Topic 13:
Animation

Animation Timeline

1911: Winsor McCay (1867-1934) makes his first film, LITTLE NEMO. McCay, already famous for comic strips, used the film in his vaudeville act. His advice on animation:

Any idiot that wants to make a couple thousand drawings for a hundred feet of film is welcome to join the club.

1928: Walter Disney (1901-1966) working at the Kansas City Slide Company creates Mickey Mouse.

1974: First Computer animated film "Faim" from NFB nominated for an Oscar.

Animation Principles

Squash and Stretch
Timing
Ease-In & Ease-Out
Arcs
Anticipation
Follow-through and Secondary Motion
Overlapping Action and Asymmetry

Exaggeration
Staging
 Appeal
Straight-Ahead and Pose-to-Pose

Squash and Stretch
Rigid objects look robotic: deformations make motion natural
Accounts for physics of deformation
• Think squishy ball...
• Communicates to viewer what the object is made of, how heavy it is, ...
• Usually large deformations conserve volume: if you squash one dimension, stretch in another to keep mass constant
Also accounts for persistence of vision
• Fast moving objects leave an elongated streak on our retinas

Anticipation
The preparation before a motion
• E.g. crouching before jumping, pitcher winding up to throw a ball
Often physically necessary, and indicates how much effort a character is making
Also essential for controlling the audience’s attention, to make sure they don’t miss the action
• Signals something is about to happen, and where it is going to happen.
What can be animated?

Lights
Camera
Jointed figures
Deformable objects
Clothing
Skin/muscles
Wind/water/fire/smoke
Hair
...any variable, Given the right time scale, almost anything...

Elements of CG (animation)

How does one make digital models move?

Keyframing
Physical simulation
Motion capture
Behavior rules

Keyframes

Keyframes, also called extremes, define important poses of a character:
Jump example:
  - the start
  - the lowest crouch
  - the lift-off
  - the highest part
  - the touch-down
  - the lowest follow-through

- Frames in between ("inbetweens") introduce nothing new to the motion.
- May add additional keyframes to add some interest, better control the interpolated motion.

Keyframe Animation

The task boils down to setting animated variables (e.g. positions, angles, sizes, ...) at each frame.

- Straight-ahead: set variables in frame 0, then frame 1, frame 2, ... forward in time.
- Pose-to-pose: set the variables at keyframes, let the computer smoothly interpolate values for frames in between.

Interpolation

How do we interpolate between two values?

Hold

Linear
Interpolation

How do we interpolate between two values?

value

Spline

Keyframe Animation

How do we interpolate between two values?

Particles

Position  x
Velocity  v = dx/dt
Acceleration  a = dv/dt = d^2x/dt^2

Forces

Gravity  f=mg
Spring-damper  f=-kx-cv
...

Simulation: x,v,a used to compute forces yielding total force F, F=ma used to update a, a used to update v/k...
