

Projections in Computer Graphics and Computational Photography

Aaron Hertzmann
Adobe Research

Perspective as arrangement

History of perspective

Bhimbetka Rock Shelters, India

Perspective systems

Qiu Ying, 16th century

Andrei Rublev, 1411

Van Eyck, Ghent Altarpiece, 1432

One-point perspective described by Leon Alberti, 1435

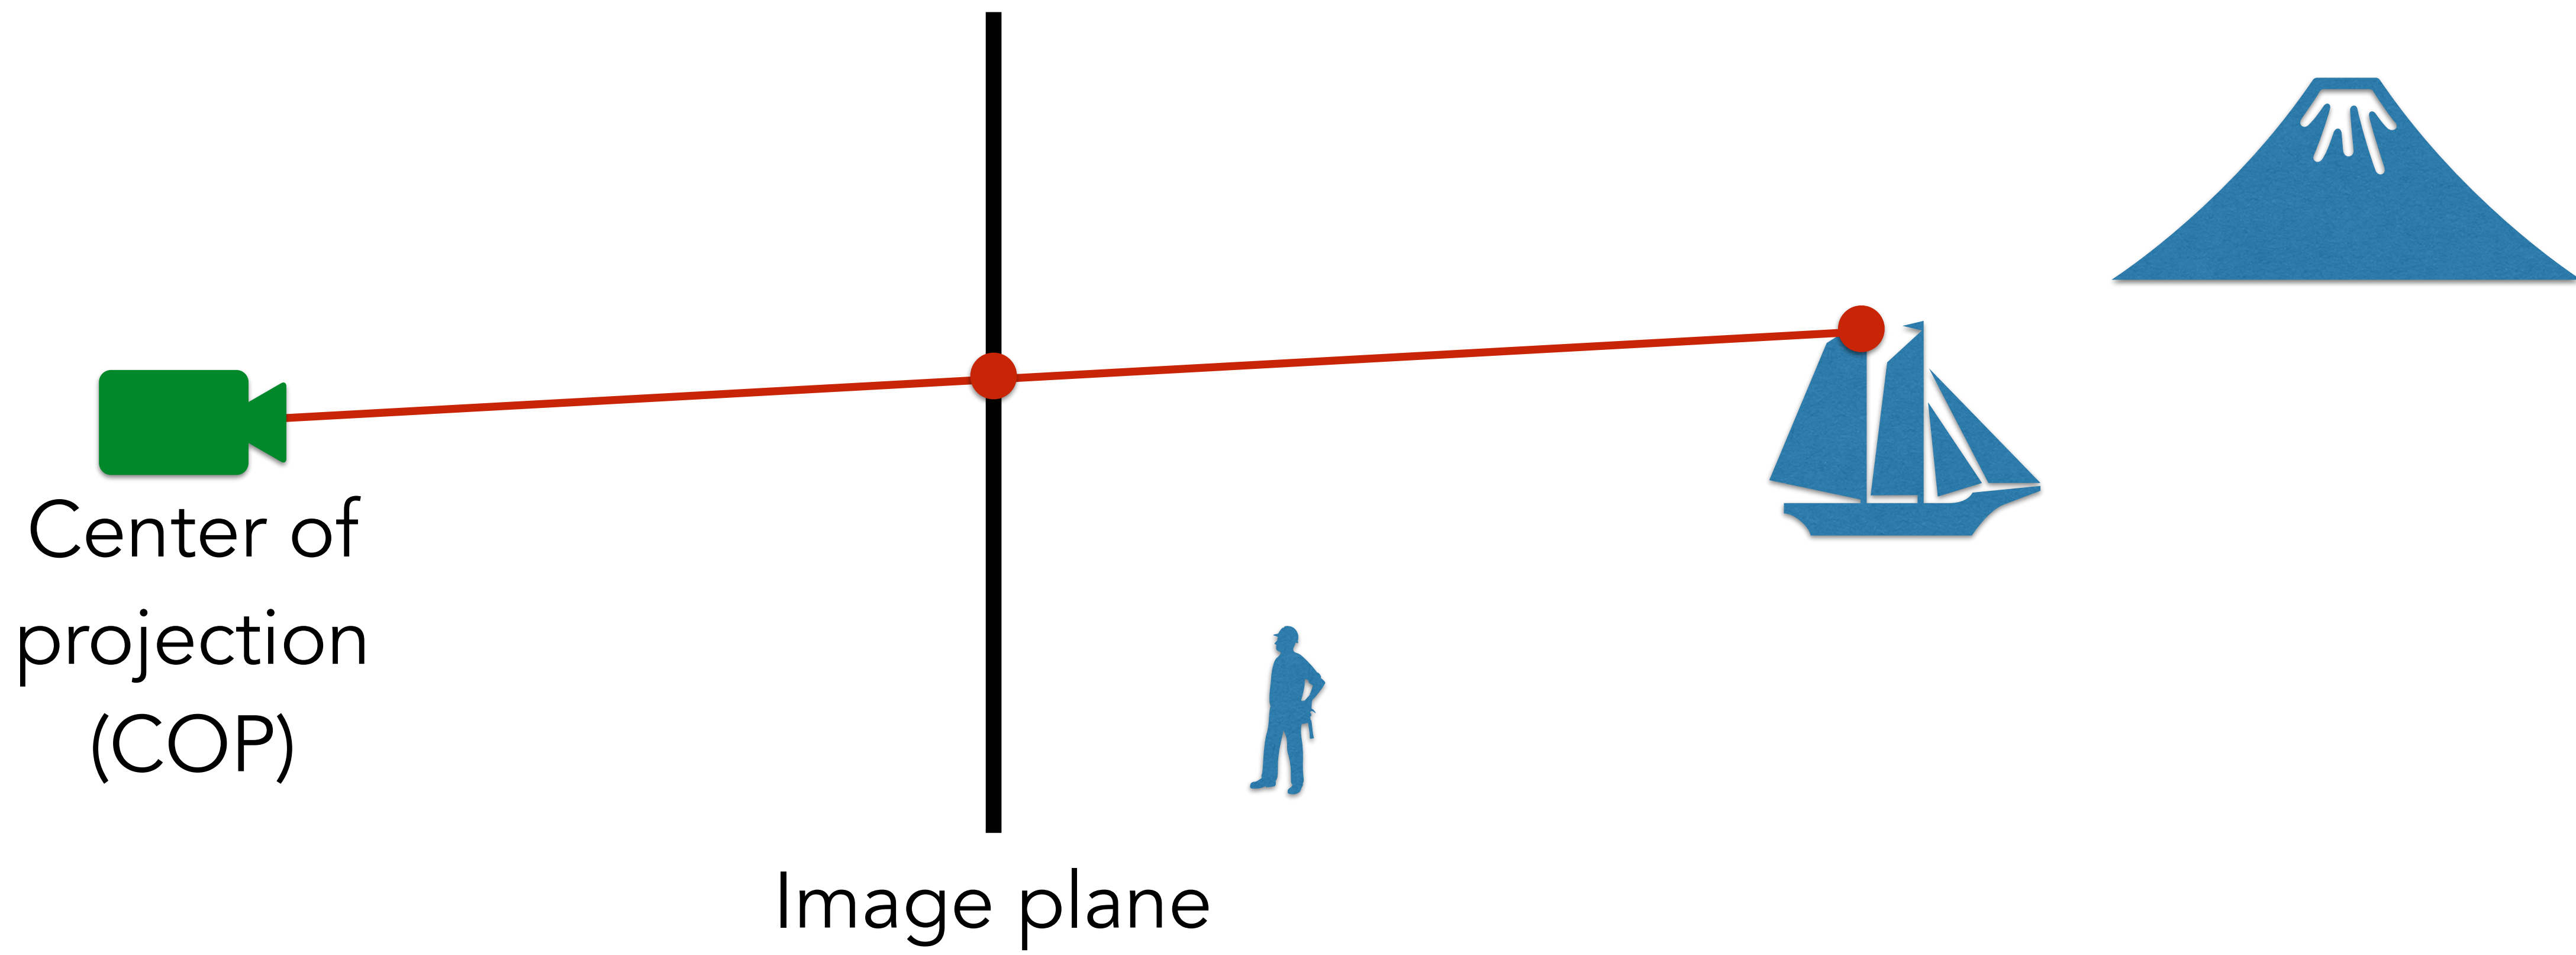

Perugino, 1481

Drawing 2 point
perspective with an
elastic band is super easy

Most cameras approximate linear perspective

Center of
projection
(COP)

Image plane

Window

G. B. Vignola, 1611

Pictures contain some of the spatial information available in natural scenes. A picture acts like a window into a virtual world;¹ it is a frozen cross-section of light to a fixed viewpoint (the center of projection), providing the pictorial depth information appropriate for that viewpoint.

Yang and Kubovy (1989)

“Linear perspective is correct”

Linear perspective derives from laws of physical optics

Artists use linear perspective to create realistic images

We interpret images as linear perspective

Problems with
linear perspective as "correct"

Lots of kinds of pictures

Qiu Ying

Matisse

Ringgold

Human vision "knows" pictures aren't reality

Human vision “knows” pictures aren’t reality

Romero (2018), Snow and Culham (2021)

The light your eyes would see ignoring:

- Binocular vision
- Accommodation/focus cues
- Limited dynamic range
- Lack of motion cues

COP viewing

Where is the COP?

What is COP viewing distance?

On my iPhone 13:

~ **$3/4 W$** , where W = image width
in landscape orientation, default zoom (1x)

For 8" (or 20cm) wide image, your eyeball
should be 6" (or 15cm) from the screen

We rarely view from focal center

KANINE

Marginal distortions

Marginal distortions

*Variations des Aspects et des Images des Corps
se déplaçant par rapport au Dessinateur*

Fig. 243

Fig. 244

Fig. 245

Fig. 245^{bis}

Images des contours apparents de la Sphere (Fig. 242 et 243) et d'un Vase ou Solide de révolution (Fig. 244, 245 et 245^{bis}) se déplaçant par rapport au Dessinateur (Voy. § 324 et la note).

Aspect ratio 1:1.2

Shih (2019)

that is not centered on the principal ray is an ellipse. Nevertheless, if the projectively correct ellipses were substituted for the circles with which Raphael represented the spheres in his *School of Athens*³ (Figure 7-9 and the detail in Figure 7-10), they would not look like spheres (unless the fresco were viewed through a peephole at the center of projection). This misperception of the correct projection of a sphere is a marginal distortion very much like the misperception of projectively correct representations of the vertices of cubes when they are outside the area of normal perspective (because they are likely to violate Perkins's

Do artists use linear perspective?

Kemp (2022): only 3% of classical paintings strictly followed linear perspective

See also Haertel (2014), Koenderink (2016)

Linear perspective is "a **working tool** that delivered convincing results when used in a pragmatic manner, without following the rules slavishly." (Kemp 2022)

Pieter Jansz, 1641

“Linear perspective is correct”

Linear perspective derives from laws of physical optics

- Viewer is rarely at the COP; binocular vision, focus, etc.

Artists use linear perspective to create realistic images

- Strict linear perspective artwork is very rare

We interpret images as linear perspective

- Why does strictly linear imagery have distortions?

Bryan et al. (2012), Cooper et al. (2012), Fried et al. (2016)

Linear perspective is important,
but it isn't everything

Tone mapping

Most display devices cannot reproduce outdoor brightnesses

Real scenes can have dynamic range of 30,000:1

Debevec and Malik (1997)

Artists and photographers do spatially-varying, content-dependent tone-mapping

Gharbi (2017)

NightSight (Liba 2019)

Google RealTone

Smartphones do content-dependent, spatially-varying tone-mapping (e.g., Levoy 2018, Liba 2019, Chayka 2022)

But perspective is entirely linear

Computer graphics/
computational photography

Considerations

Distortion

Scene perception

Composition/arrangement

Two goals

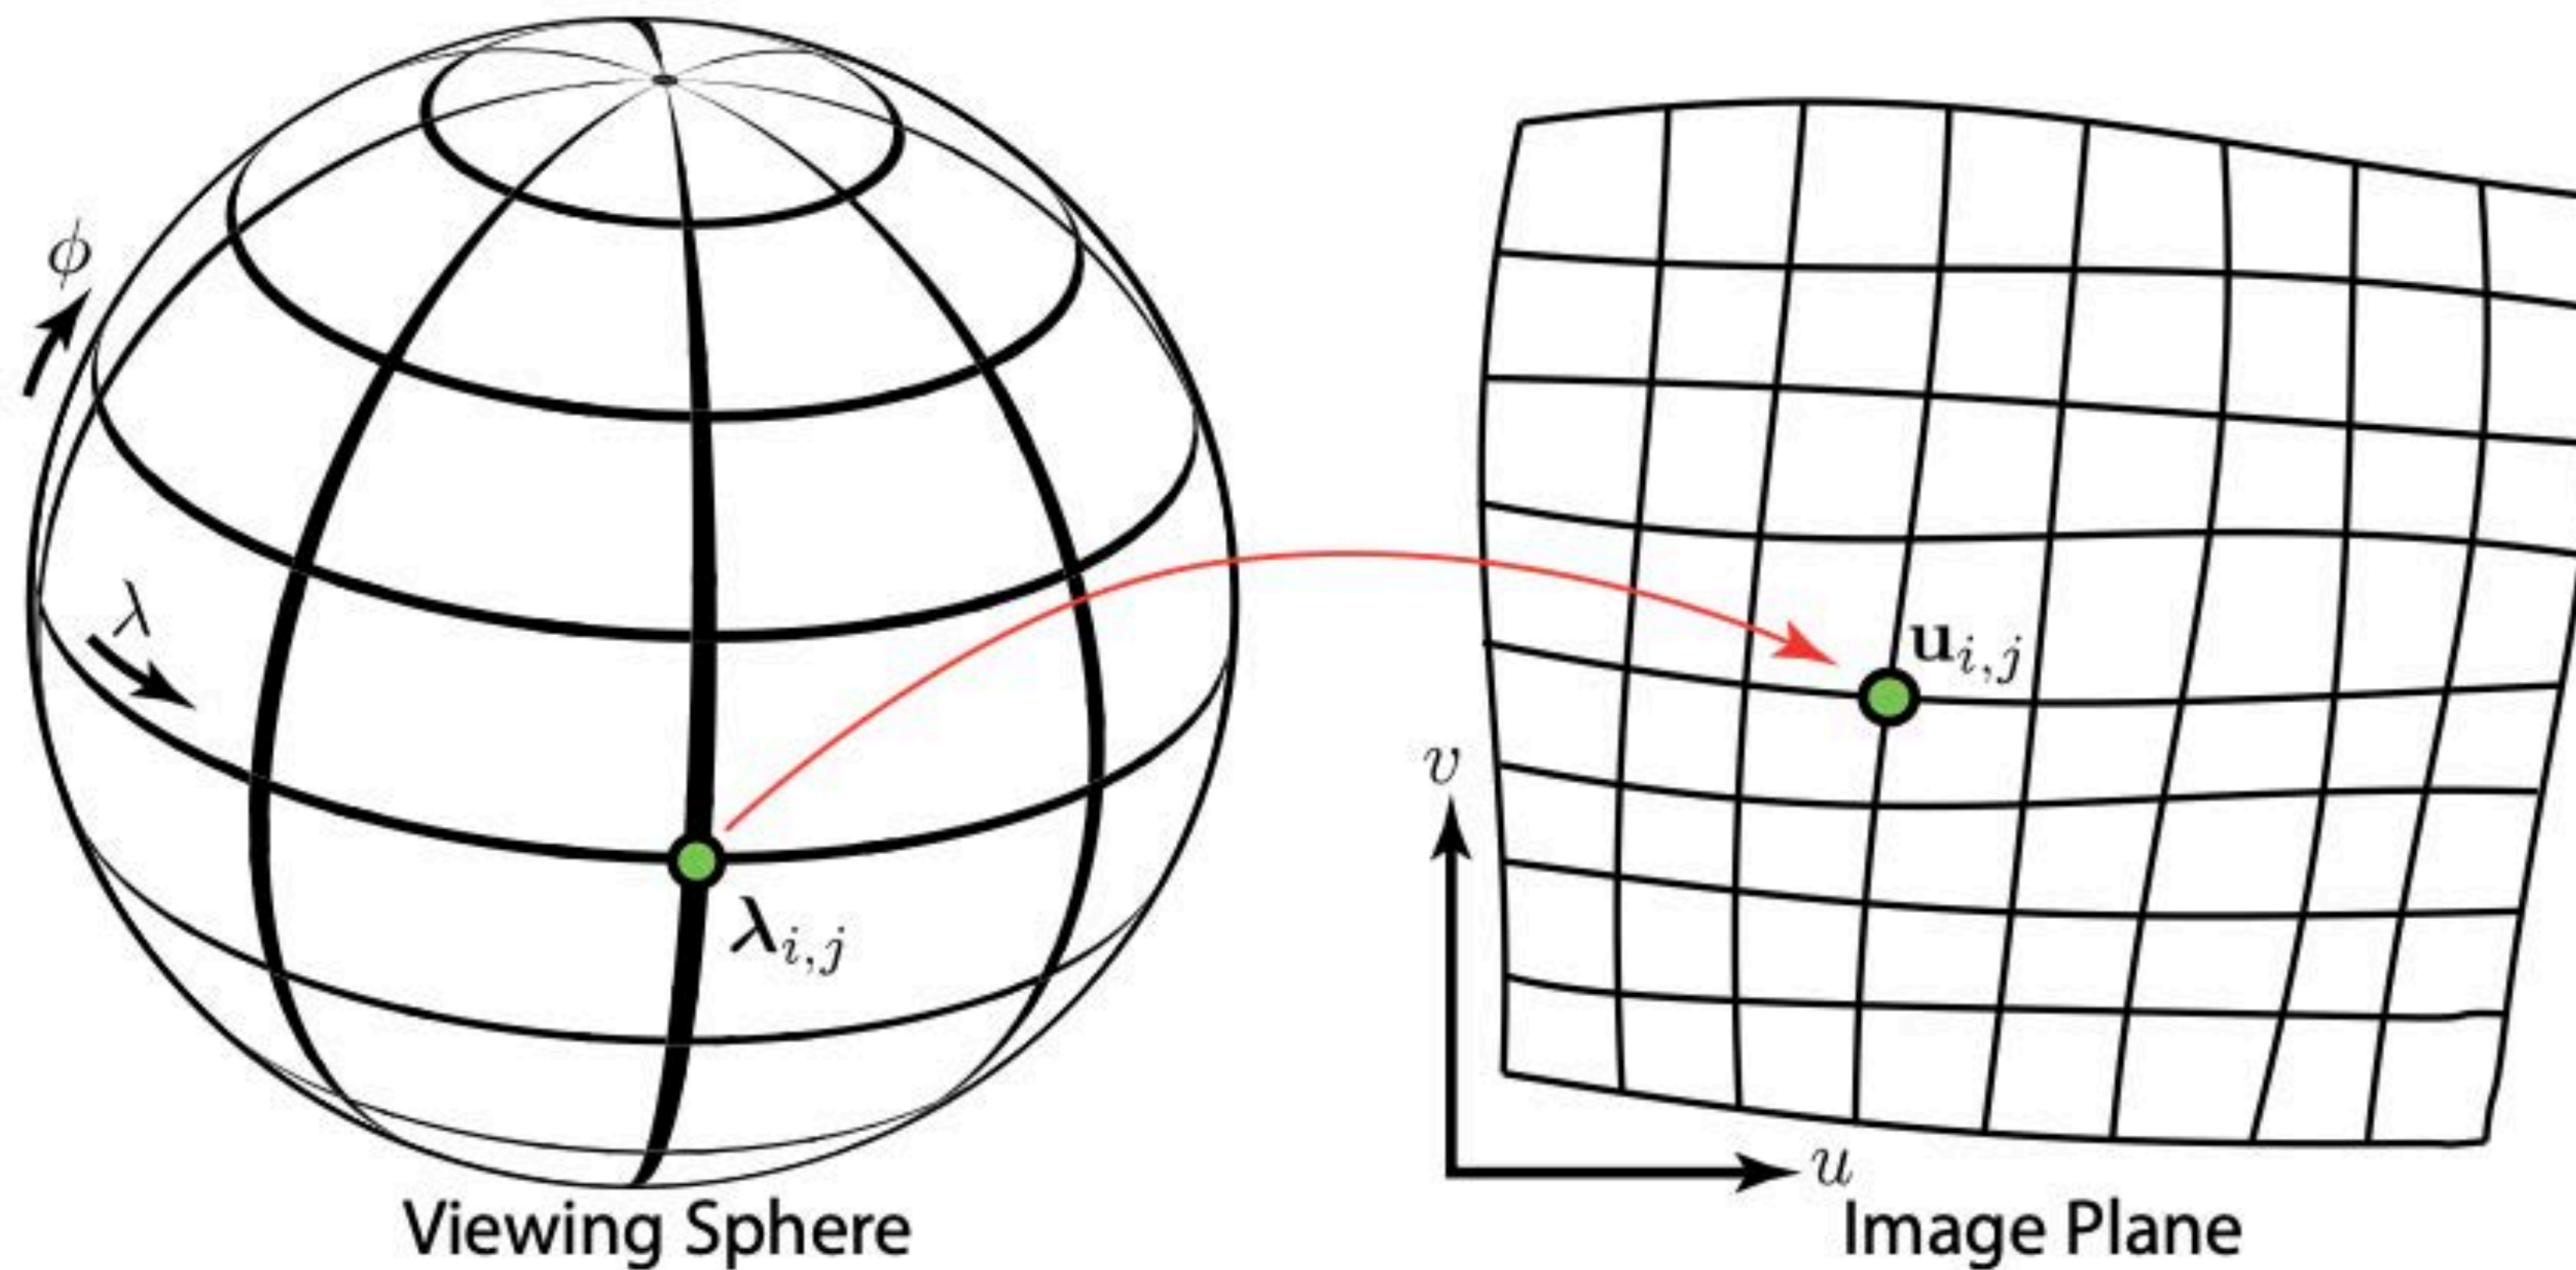

Wide-angle
without distortion

"Artistic" effects

Parameterizing projection

Stereographic projection

Input Photo (linear)

Stereographic

Artists' projections are "content-aware"

Direct View Condition

“Objects in the image should look as if they are viewed directly — as they appear in the middle of a photograph.”

— Zorin and Barr (1995)

Direct View Condition special cases

Empty
patches

Straight
lines

Spheres

Texture

Content-Aware projection

Content-Aware Projection

Input Photo (linear)

Output

Input 105° FOV
(perspective projection)

Our method

Using depth or multiple shots

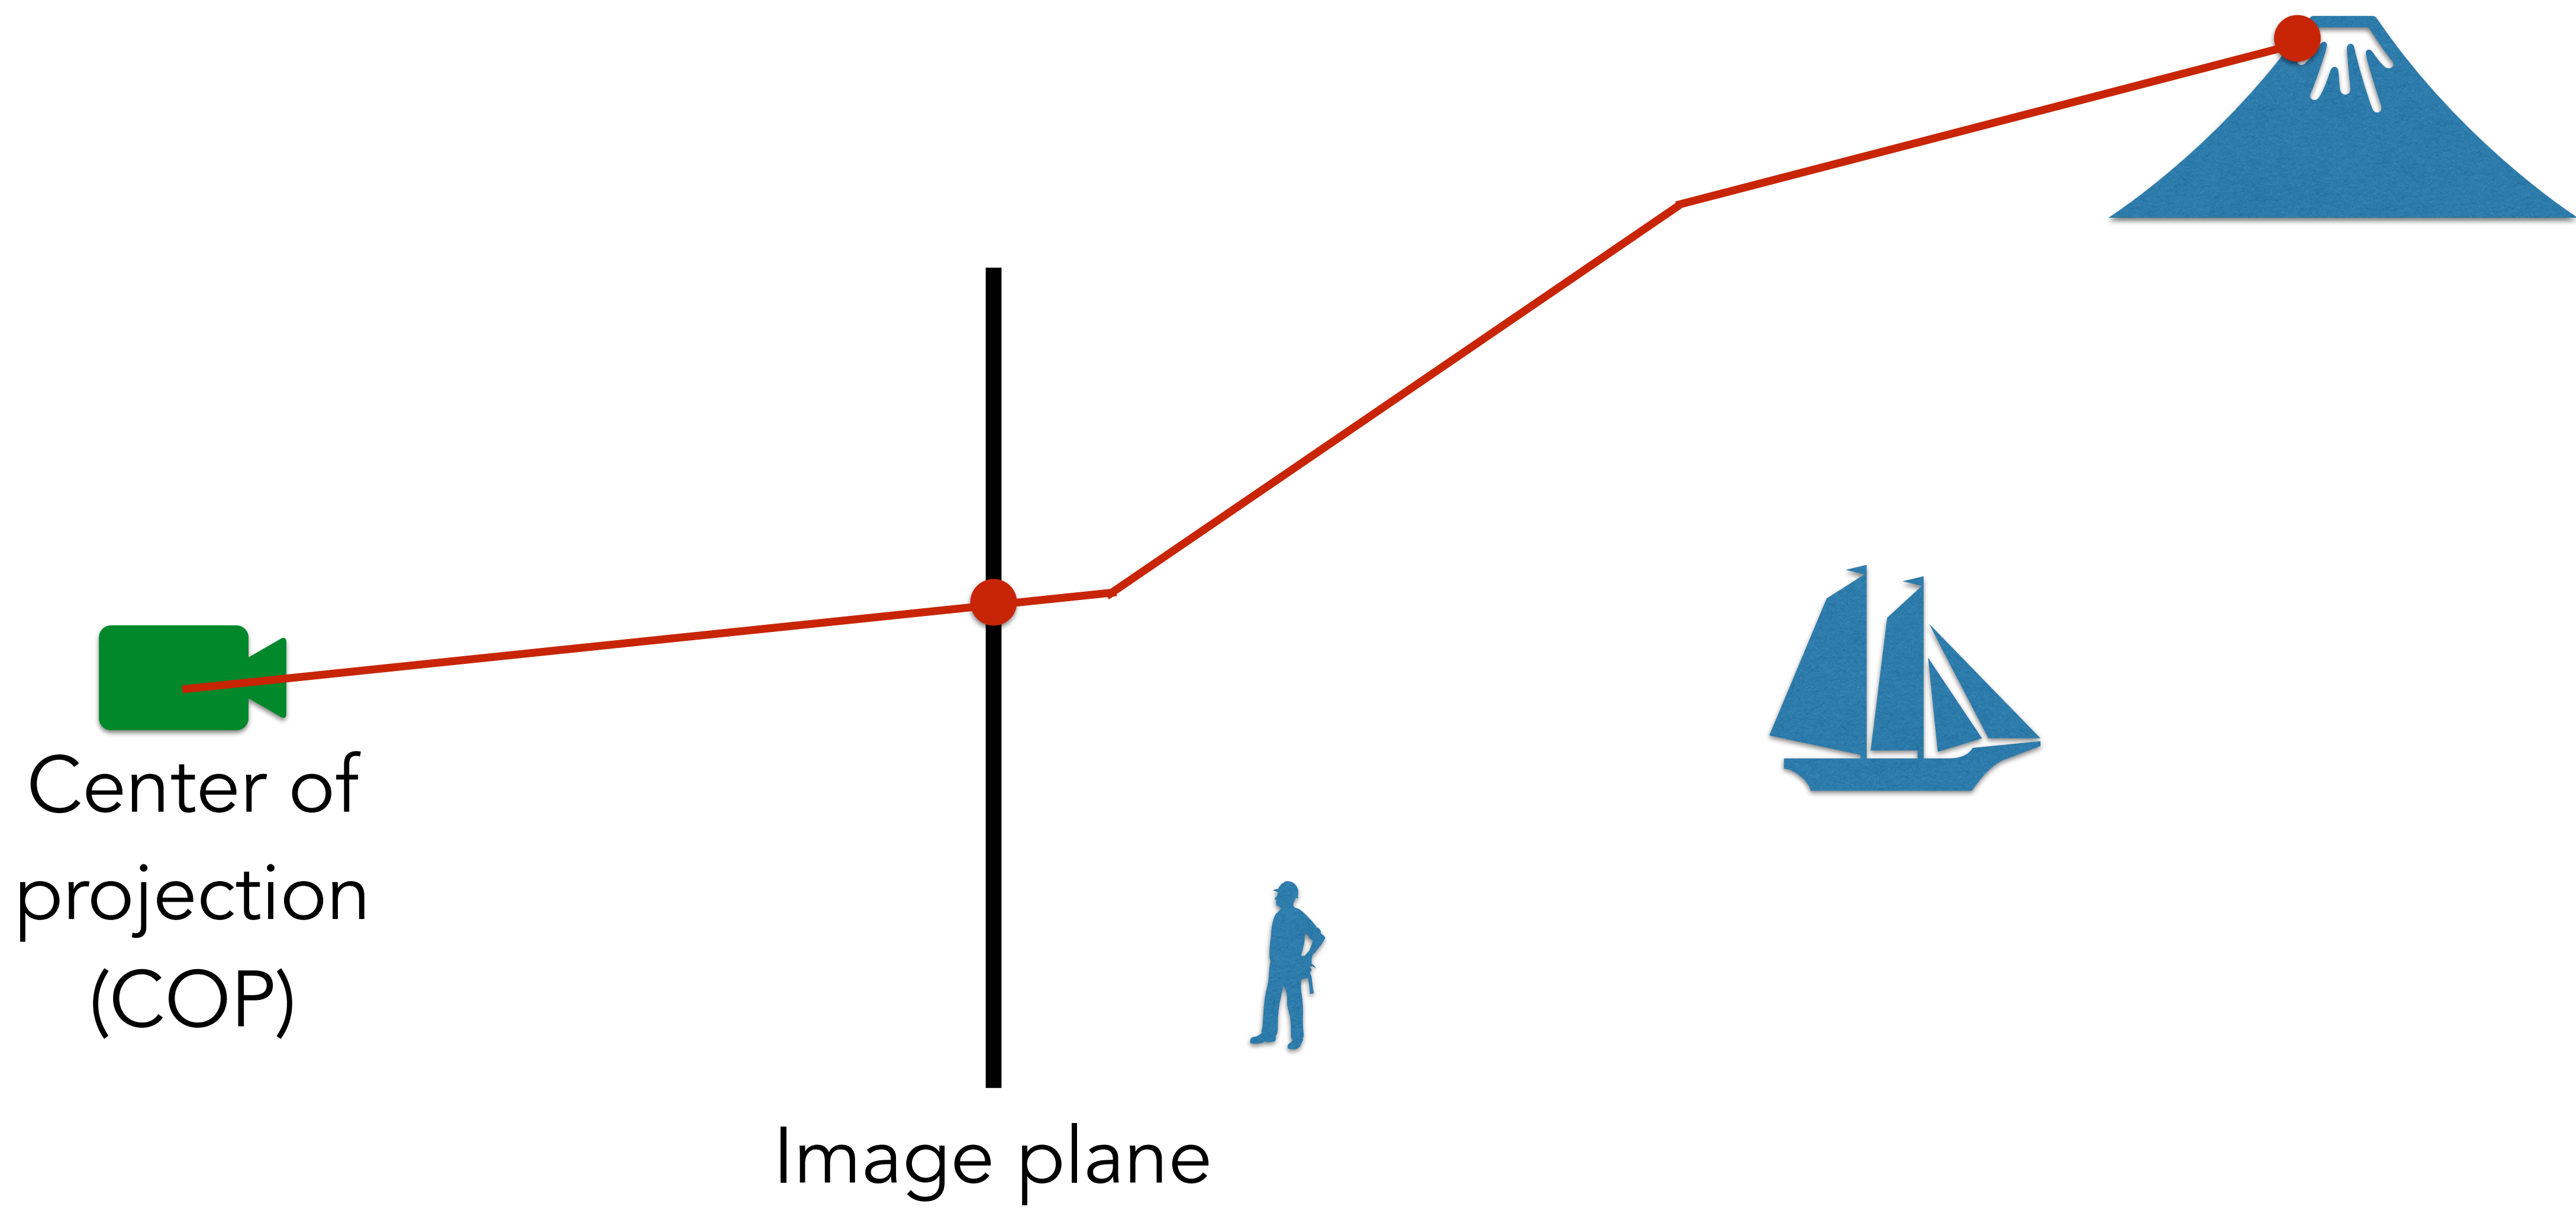

Happy Harvest Moon! 😊

Using multiple shots

“Computational Zoom,” Badki et al., SIGGRAPH 2017

Center of
projection
(COP)

Image plane

Top-down view
of camera volume

Original

Zoom-in & Crop

ZoomShop

ZoomShop (Liu 2022)

Artistic projections in CG/CP

Spherical projections

Artistic multiperspective projection

Giorgio de Chirico (1914)

Agrawala, Zorin, Munzner (2000)

Cubism

Collomosse and Hall (2003)

Hockney-style “Joiners”

Zelnik-Manor and Perona (2007)

Spatiotemporal effects

"Somewhere Always" Disconnectica

"Ryan" by Chris Landreth

Preproduction artwork

Film still

IN THE SINK

NE PAS CRACHER
DANS L'EVIER

Summary / Questions

There's no "correct" or "wrong" perspective

How do we perceive/interpret different perspectives?

What are the range of options and space of algorithms?

Depth-based photography opens up new possibilities
