Crafting & Beholding

Jan Koenderink

Leuven University
&
Utrecht University

OPTICAL AWARENESS

the animal mind (*sentience*) presents **IMAGERY**
"rational thought" (*sapience*) forges **CONCEPTS**

sentience uses an "affective logic"

sapience uses a "disenchanted logic"

reaction immediate
SENTIENCE

reaction delayed
SAPIENCE

SAPIENCE

is discursive, reflective

SENTIENCE
is immediate, intuitive

*“Now! ... That should clear up
a few things around here!”*

SENTIENCE
doesn't recognize chance

SENTIENCE admits multiple worlds, its resolution is ACTION
Only the moment NOW (including past and future) counts

Arnold Böcklin

for SENTIENCE anything seen is thereby REAL

no help to protest centaurs don't exist if you meet one!

in real life you need to deal with ANYTHING in actuality

in SENTIENCE anything has either an **inner life** or is subject to **magical forces** that are objectified

SENTIENCE counts "objects" differently from sapience:
the two women at centre compose a single visual object

↑
"passage"

Vincenzo Cabianca

SENTIENCE doesn't reckon with "half a man" so it freely invents a whole one

← "lost contour"

two very different visual objects "composed of swans"
& a strange visual object composed of sparrows

if a shape is amorphous, sentience may ignore it or create something unexpected

"dolphin with eye"

Bernini

nothing special

these count as
equivalent forms
though they may
have different
feelings to them
(hard, soft,
heavy, light,
smooth, rough, ...)

it is "VISUAL FORM"
at the gut level

SENTIENCE
doesn't **LOOK**
for things, it
FINDS THEM!

"attention"
is a
SAPIENT
concept,
SENTIENCE
doesn't need it

the toad uses a **seek image** in order to **find food**

aesthetics is "sensible wit"

PSYCHOGENESIS

awareness happens (like sneezing)
you don't do it

pictures are artfully crafted
so as to evoke imagery

DEPTH is a
bead shifting game
in pre-awareness

"abacus model" of
pictorial depth

if **VISUAL SENSE** conflicts with sapience it is called **ILLUSION**

"... distance, ... cannot be seen. For distance being a line directed end-wise to the eye, it projects only one point in the fund of the eye, which point remains invariably the same, whether the distance be longer or shorter."

psychogenesis,
a bead shifting game

visual

ray

Bishop Berkeley,
Essay towards a New Theory of Vision,
1709

the relative depth of the confetti is indeterminate

this is not a **VISUAL** 3D cloud

inflections of surfaces
("pictorial relief") are
different in kind from
volumetric depth

both yield "3D"

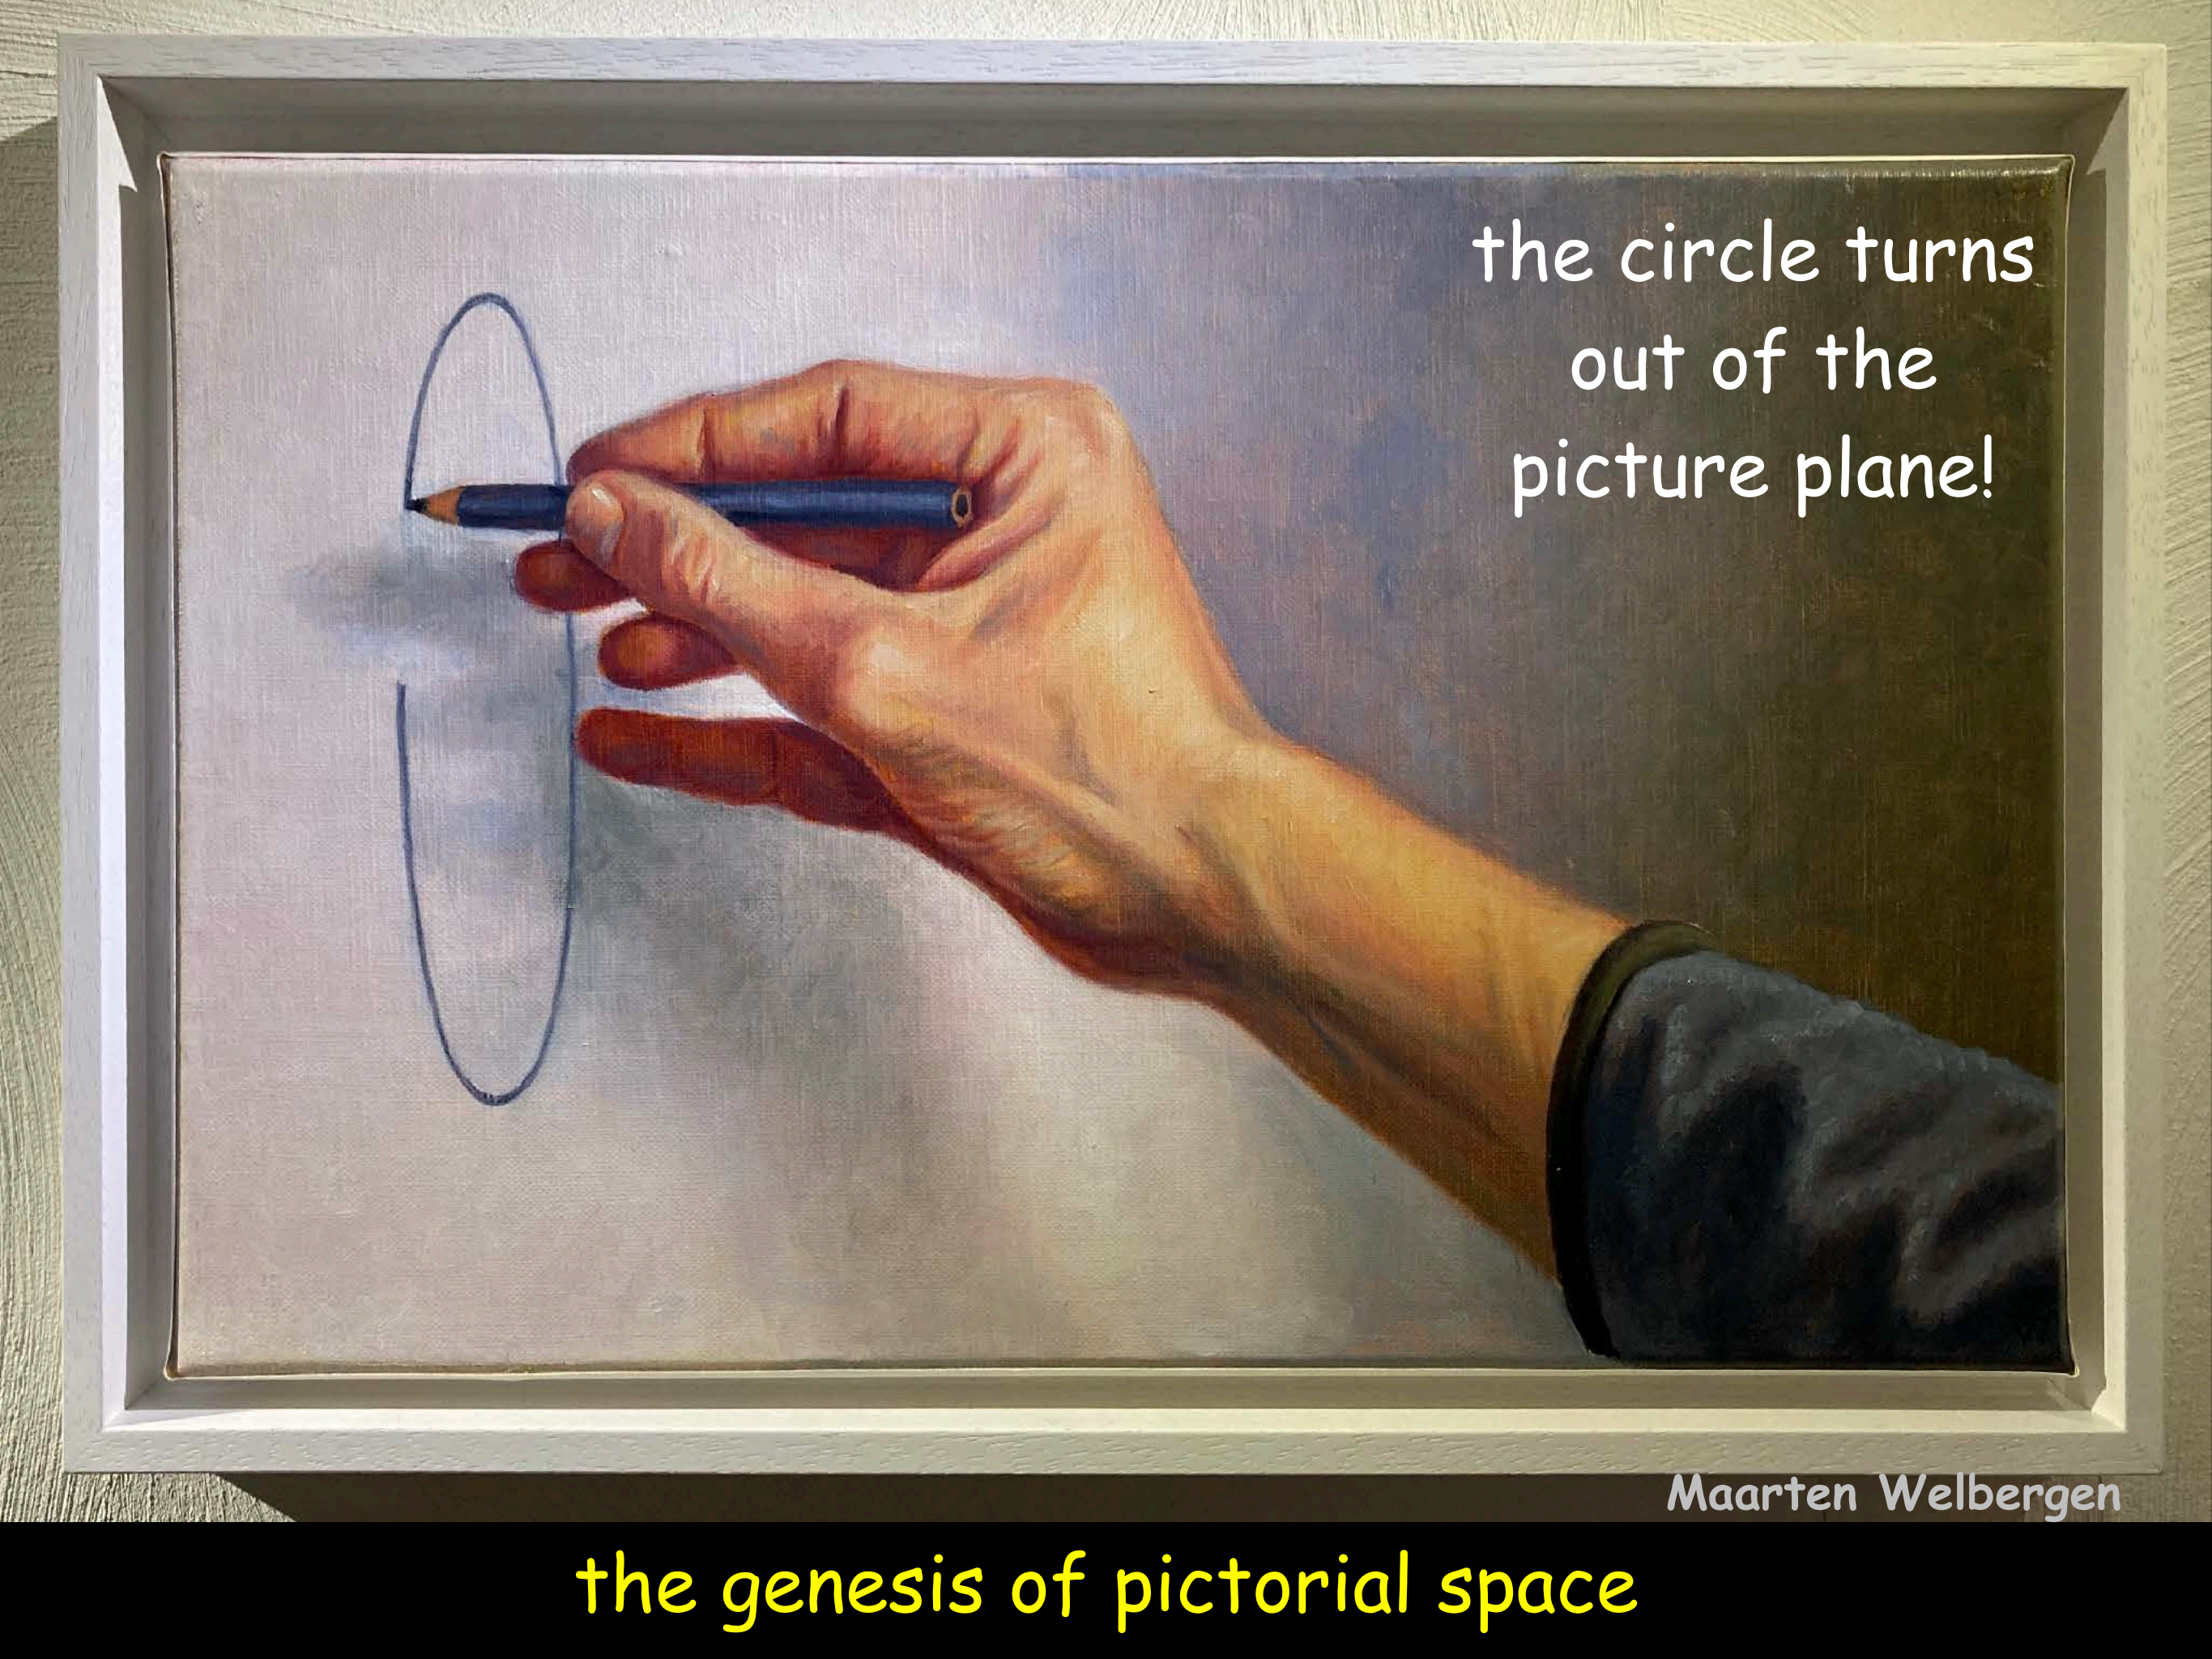

these two "depth-forms"
are often combined in
pictorial design

a painting!

Jacob de Wit

contour, occlusion, shading, layering and contrast do most of the work

A detailed oil painting of a hand holding a pencil, drawing a blue circle on a light-colored canvas. The hand is rendered with realistic shading and texture. The pencil is positioned at the top of the circle, as if in the middle of drawing it. The background is a dark, textured blue-grey. The entire scene is framed by a simple white border.

the circle turns
out of the
picture plane!

Maarten Welbergen

the genesis of pictorial space

is is not hard to use cues in picture design
the cruder the more effective!

intuitive
shading:
various
methods
work well

but is shading NEEDED?

Poussin
No. 141

less is more

it is easy to overdo shading
seeing is not inverse optics

there is no doubt about the relative locations of the stones

nails it!

the stones are anchored to the ground surface

a demonstration of
FLOATERS

visual objects have
to be **anchored** to
some substrate

a **ground shadow**
always works

head
anchored

body
floating

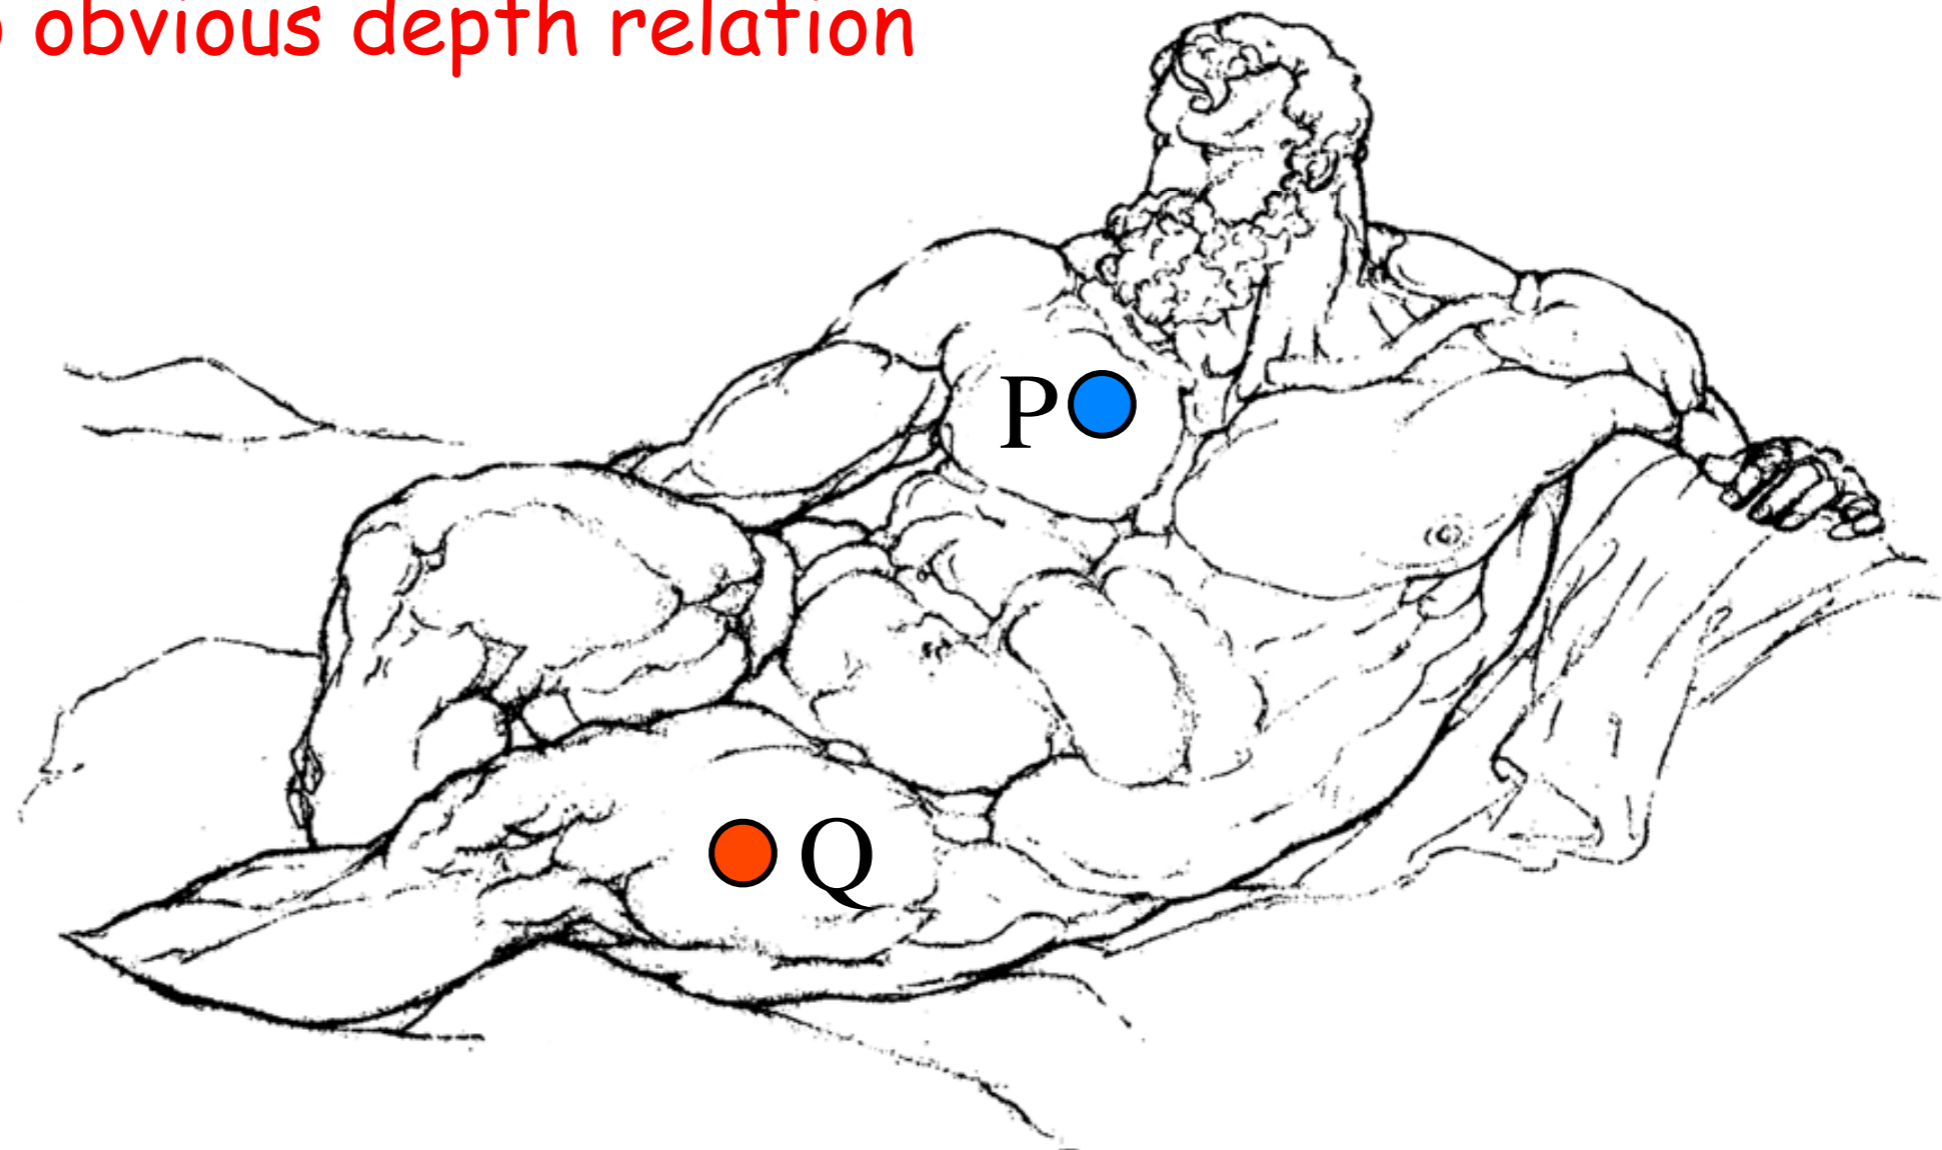

what works in a woodcut
works in a photograph

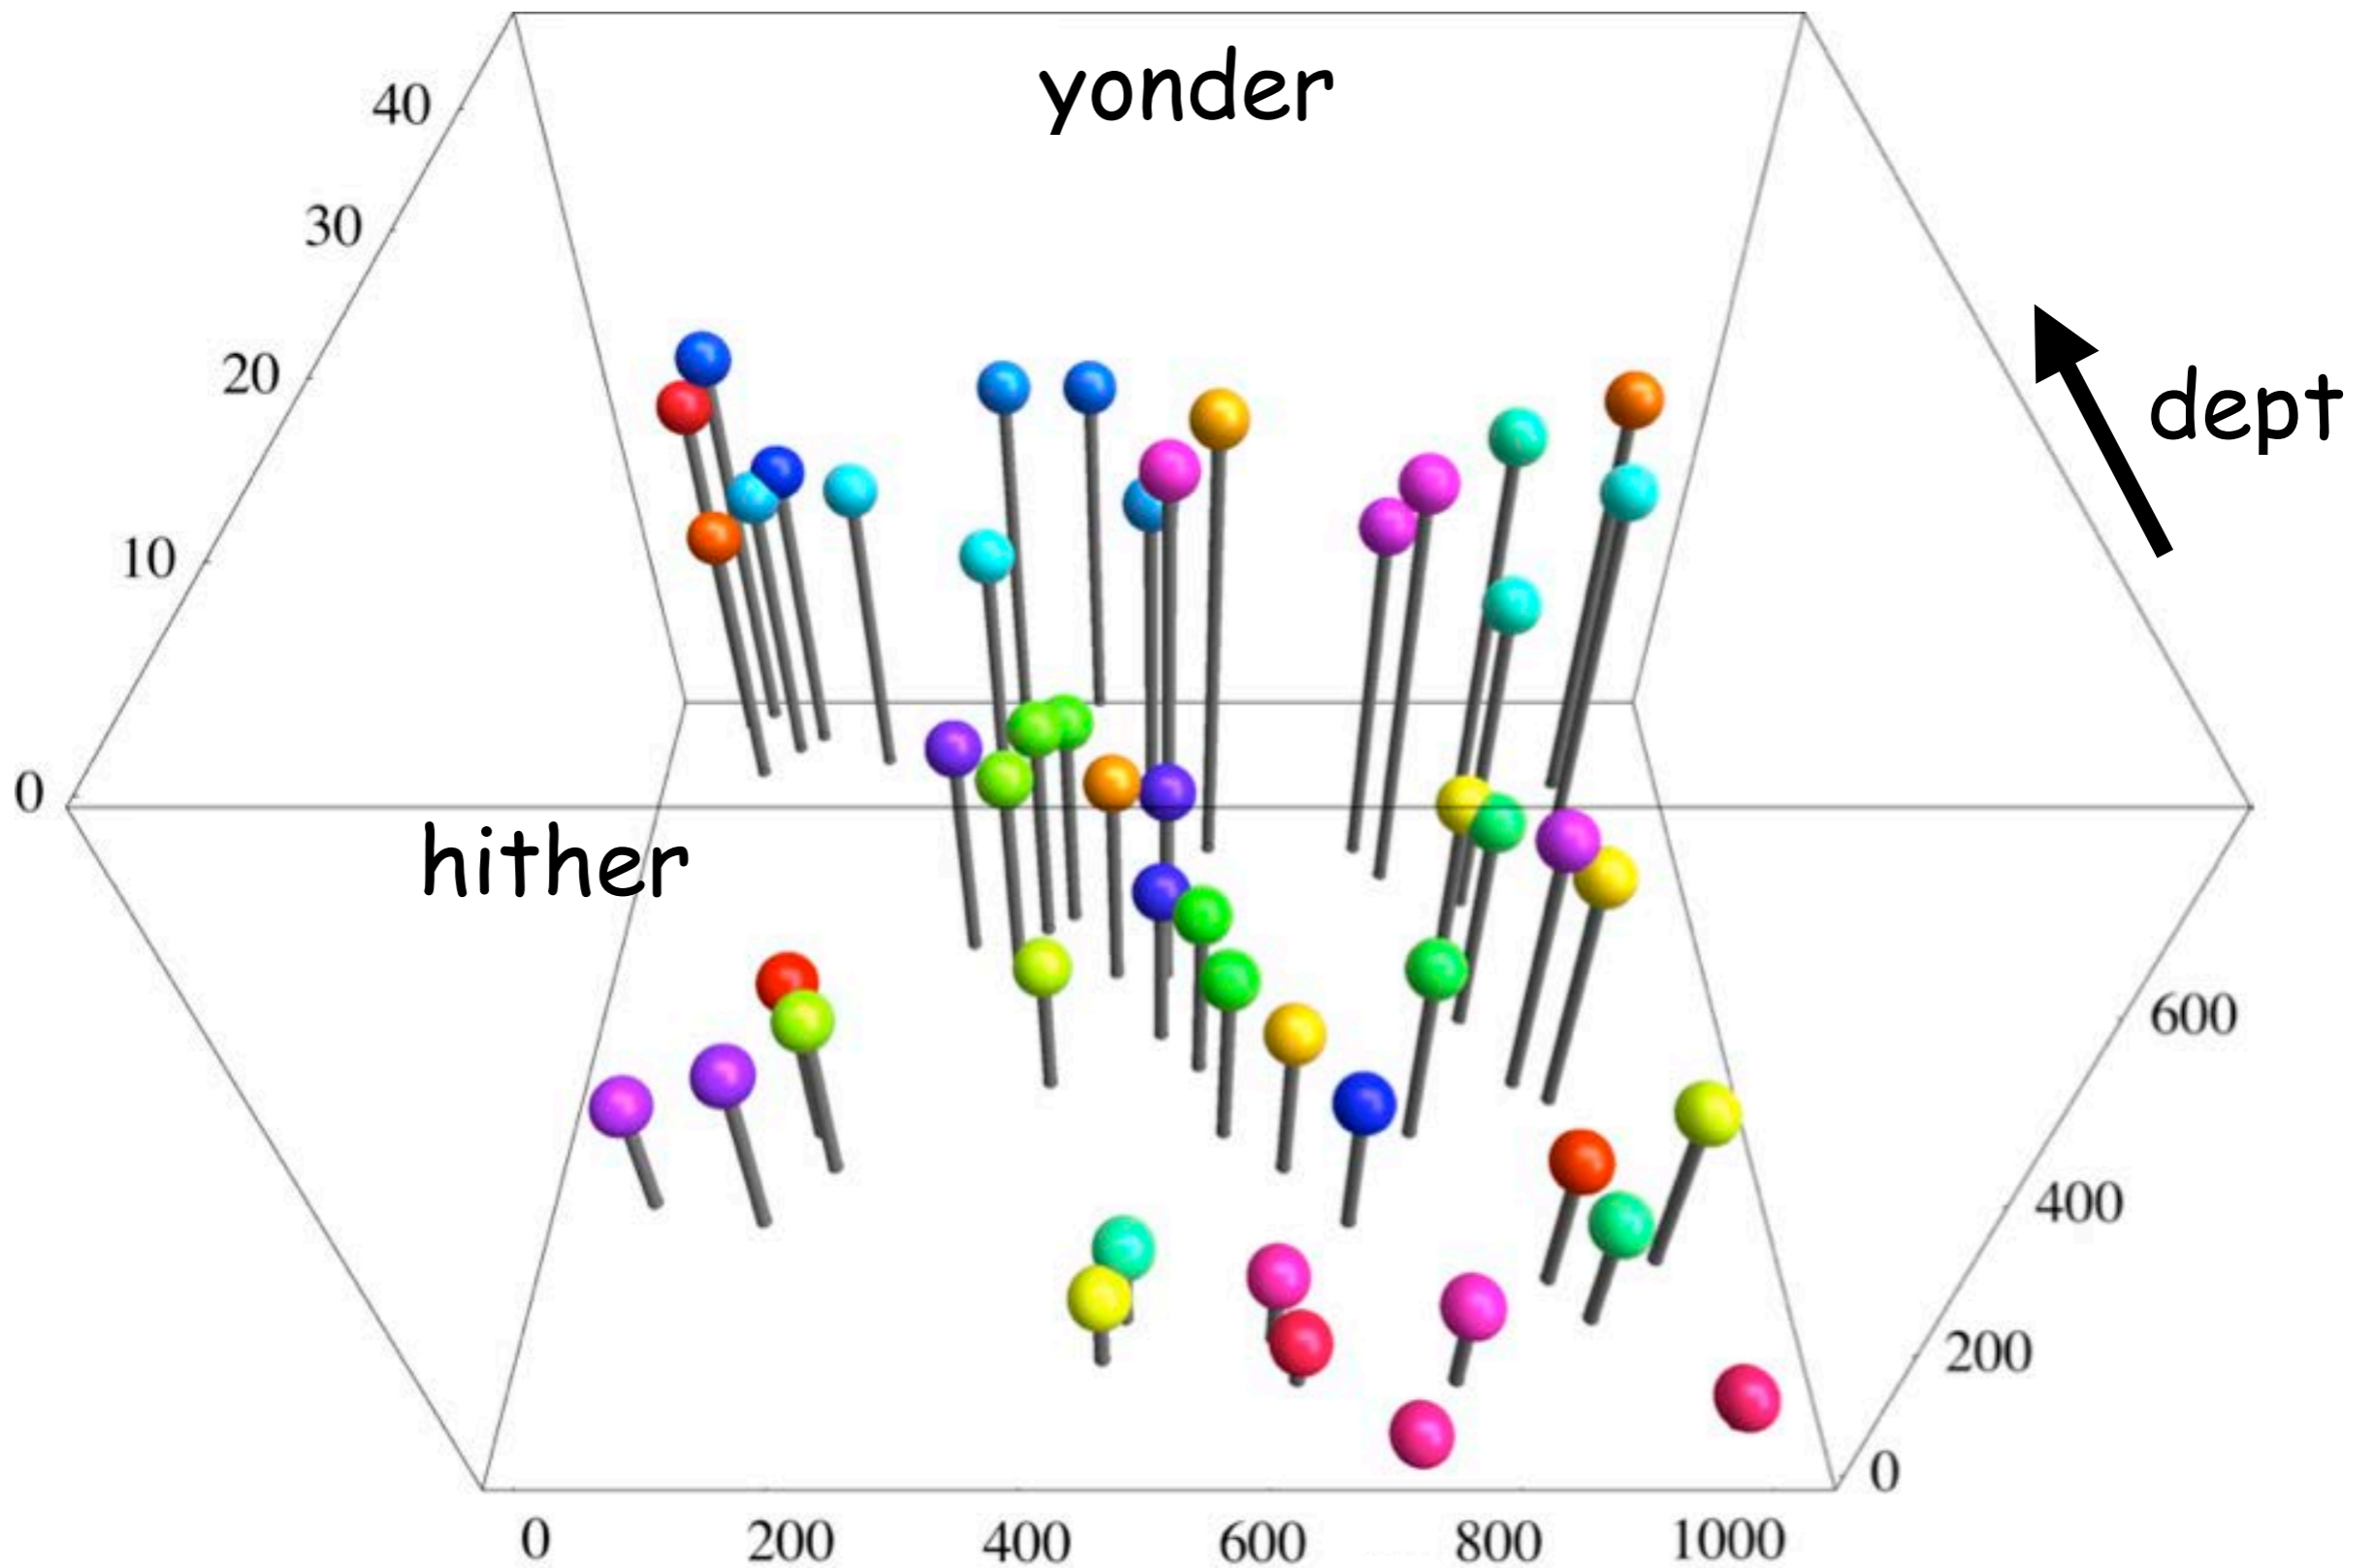

A and B have no obvious depth relation

P and Q are on a common surface, thus are related in depth

for any point pair you can ask "which one is closer?"
(experimental phenomenology)

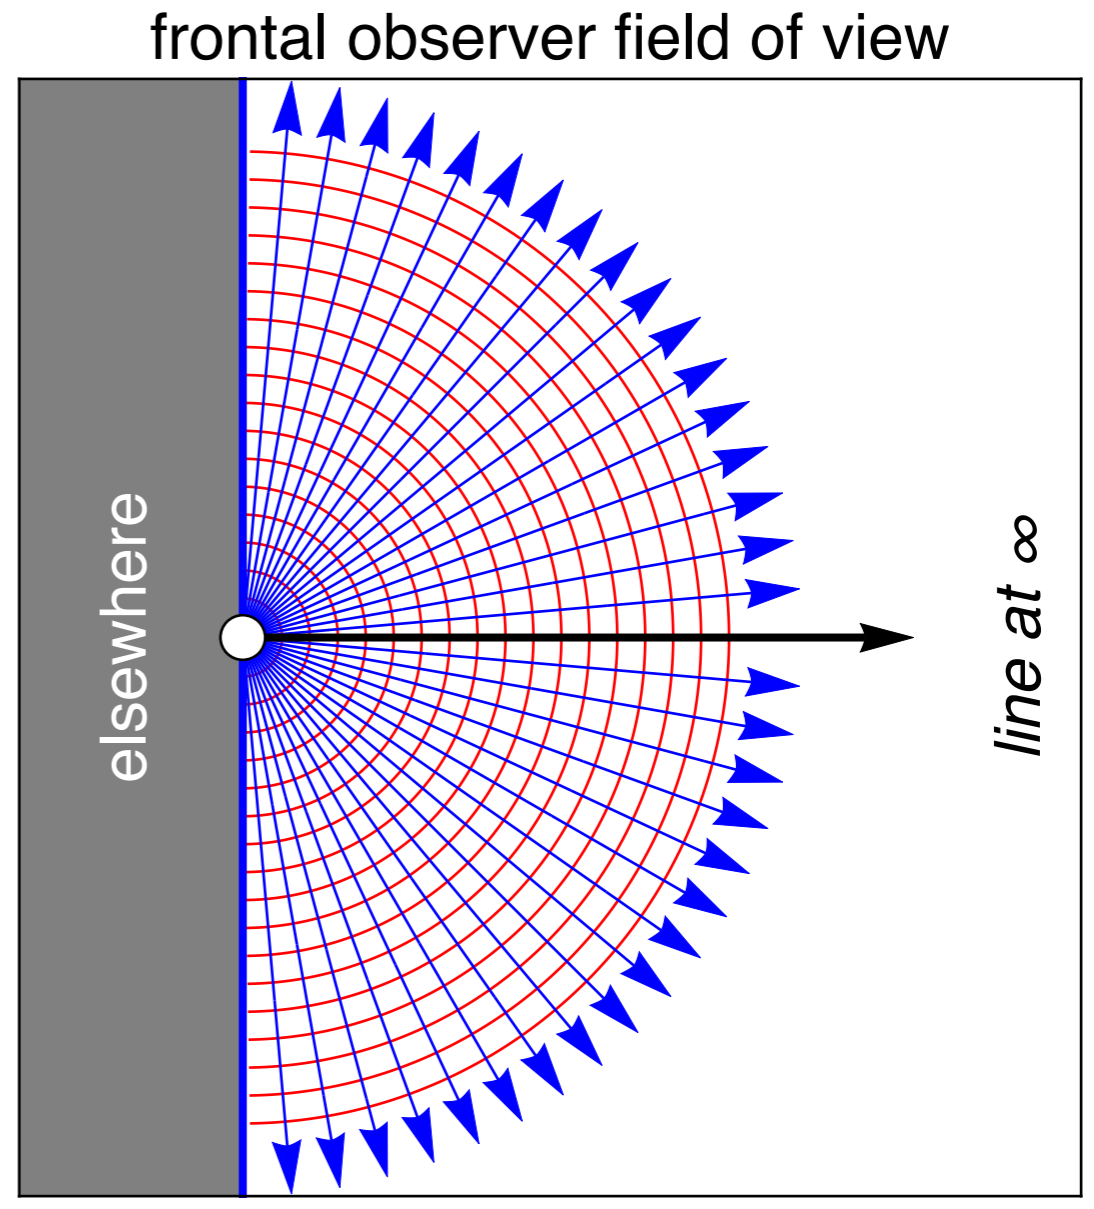

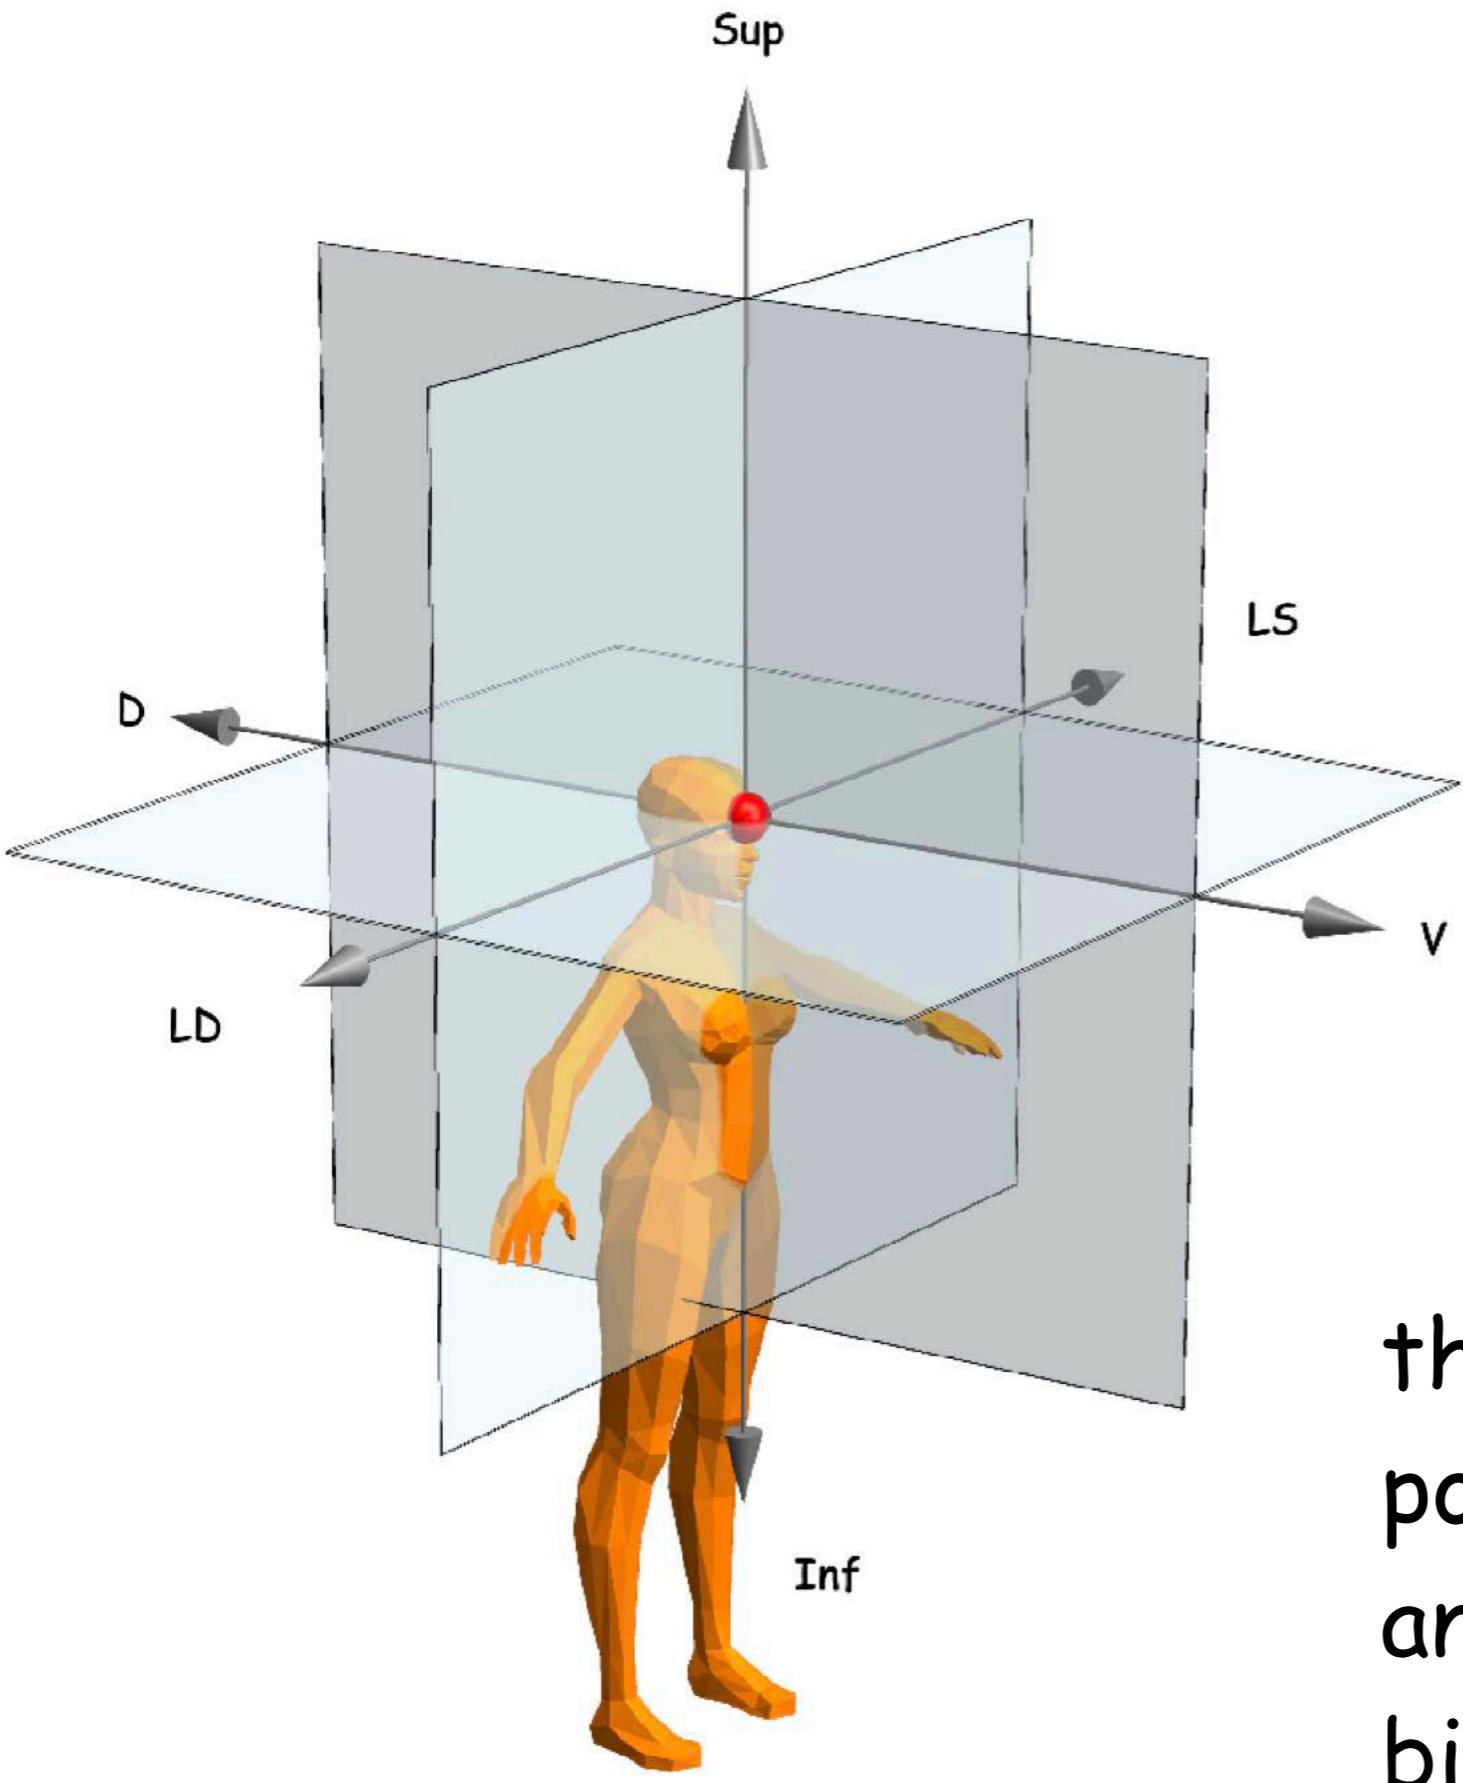

depth obtained from many 2-point comparisons

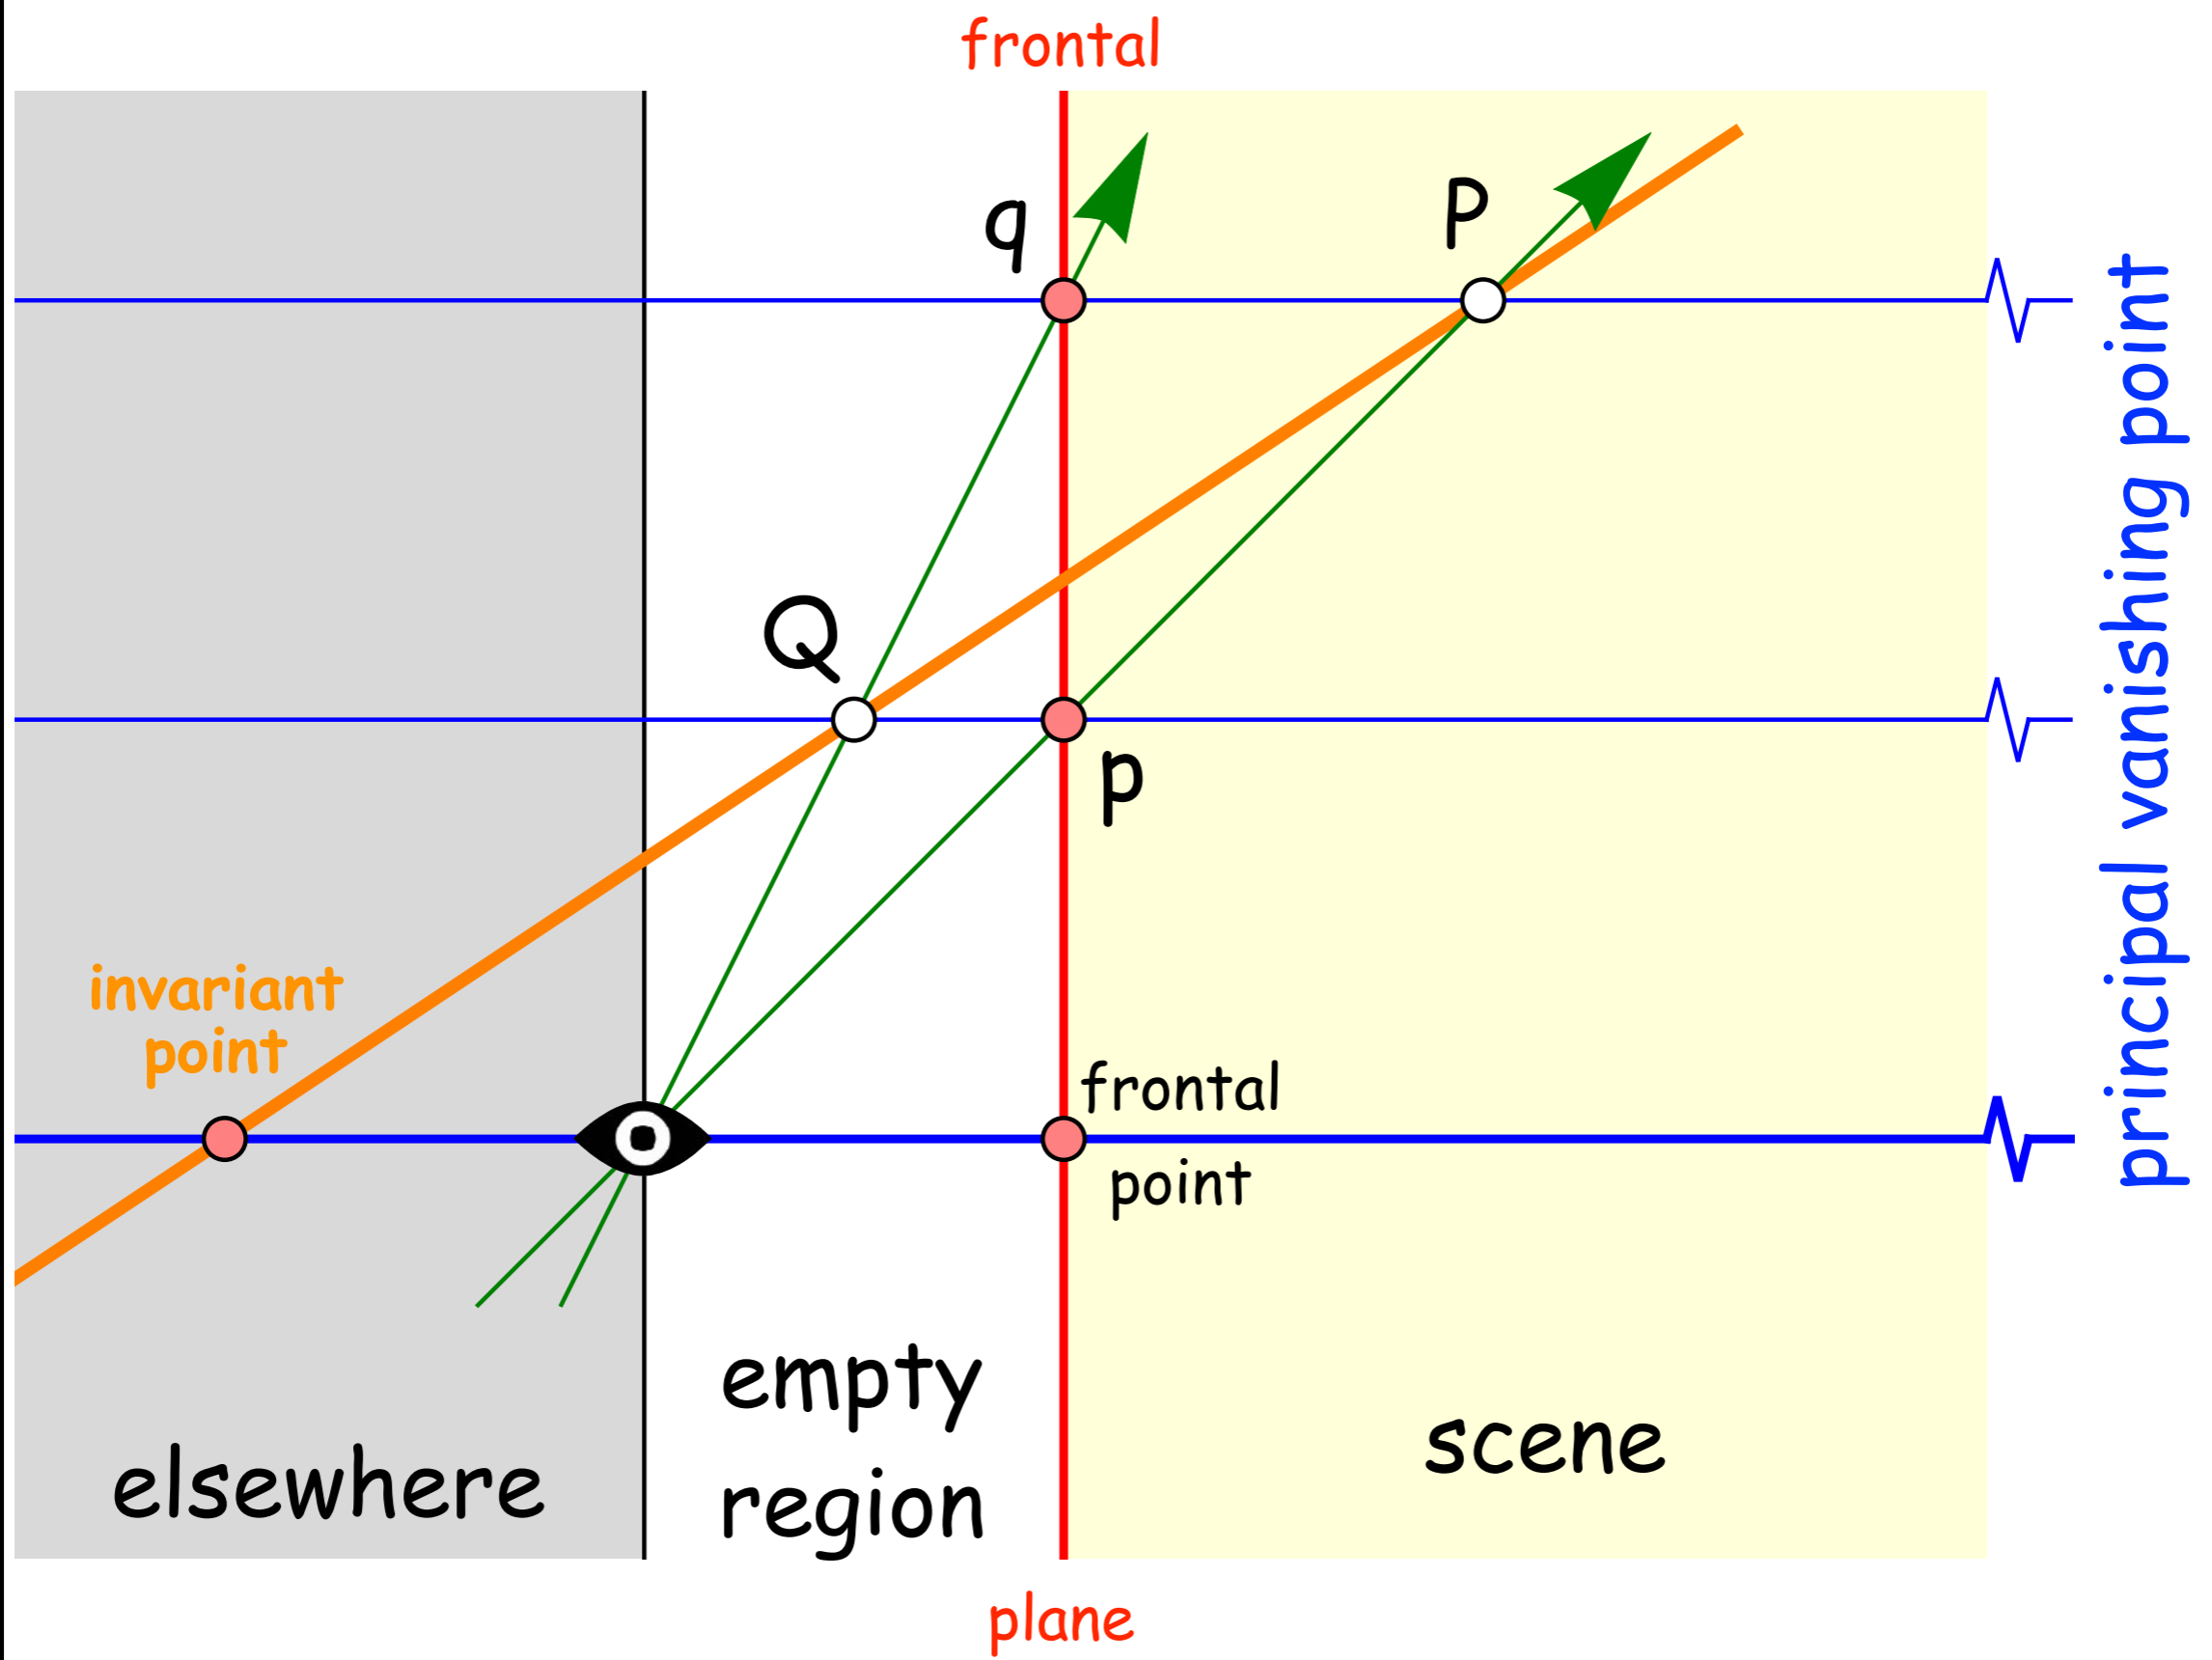

pictorial depth is FACT, not FICTION

"PERSPECTIVE"

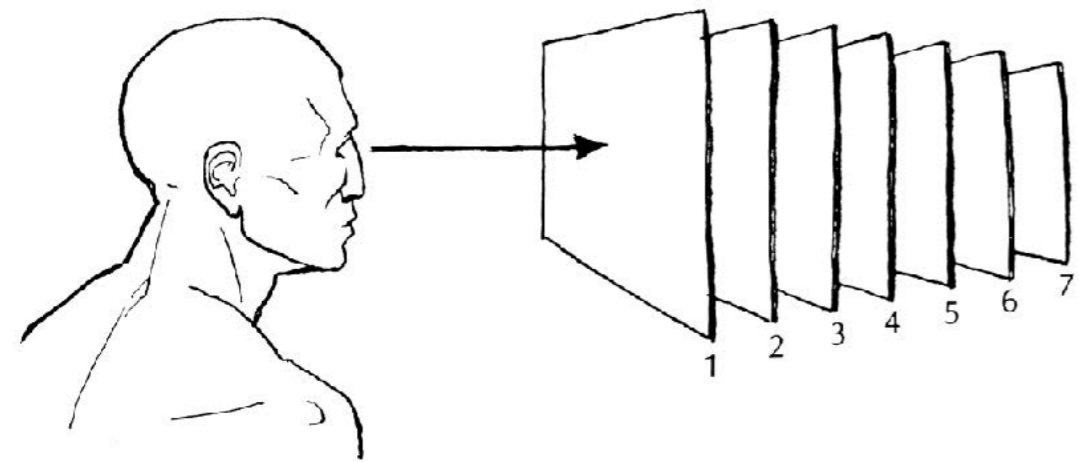

the construction of pictorial space

the human observer is polarized by frontal vision and a body tuned for bipedal locomotion

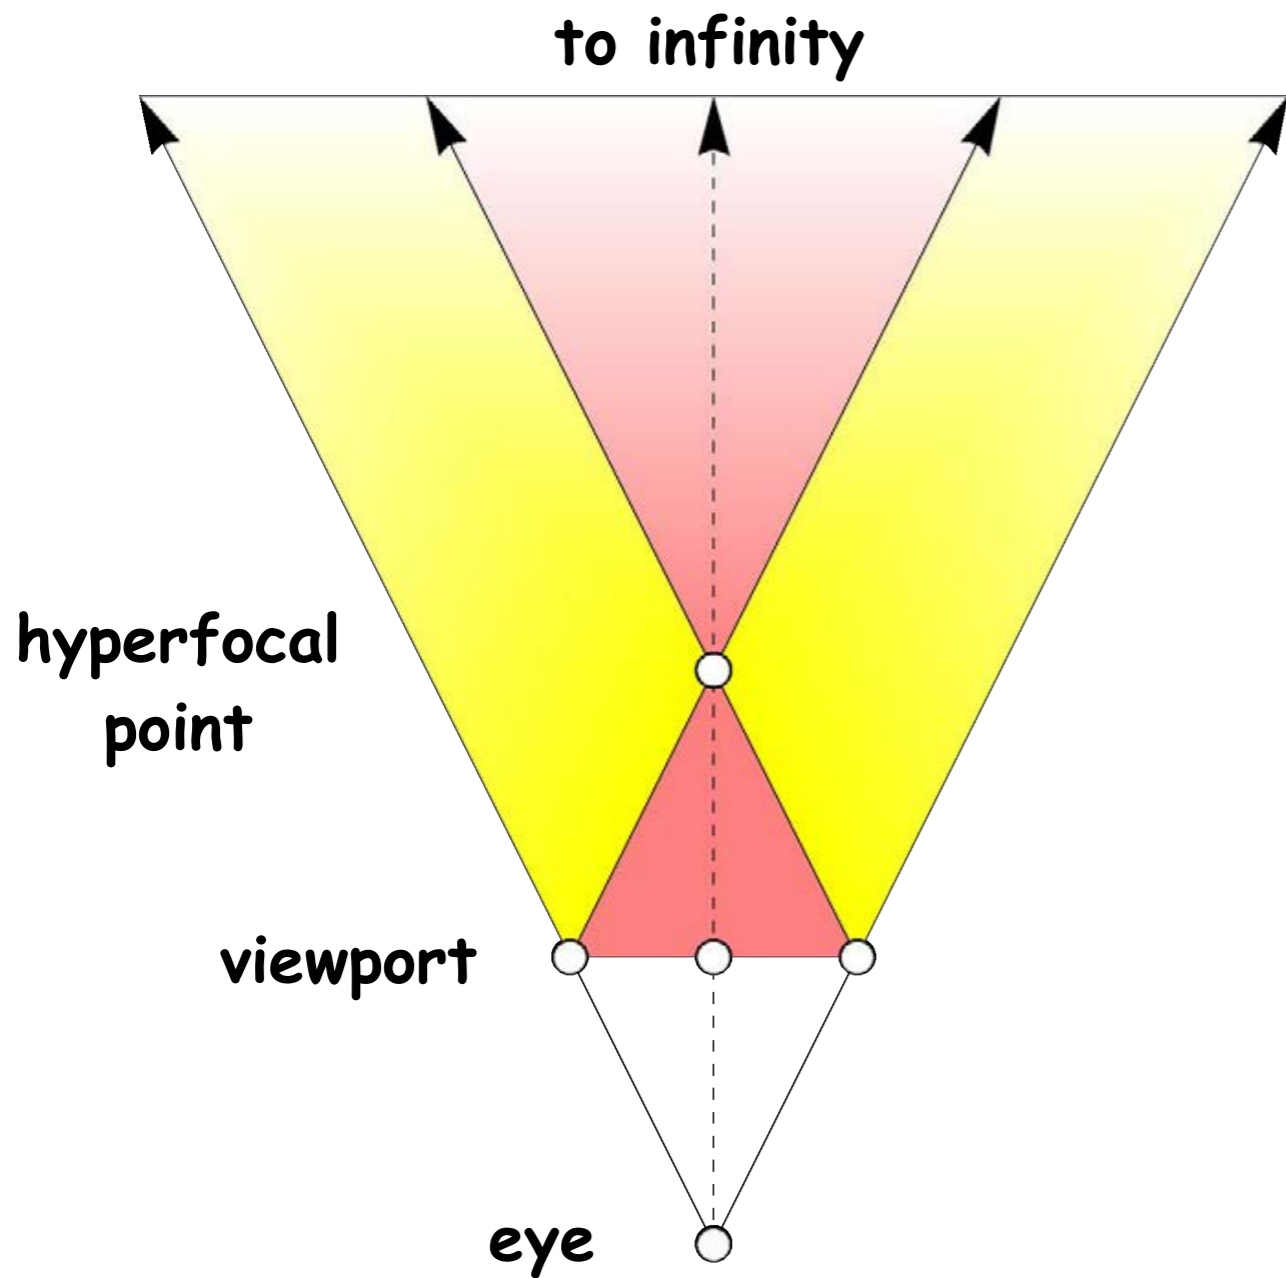

"perspective" is a hyperbolic involution that swaps the eye and the principal vantage point

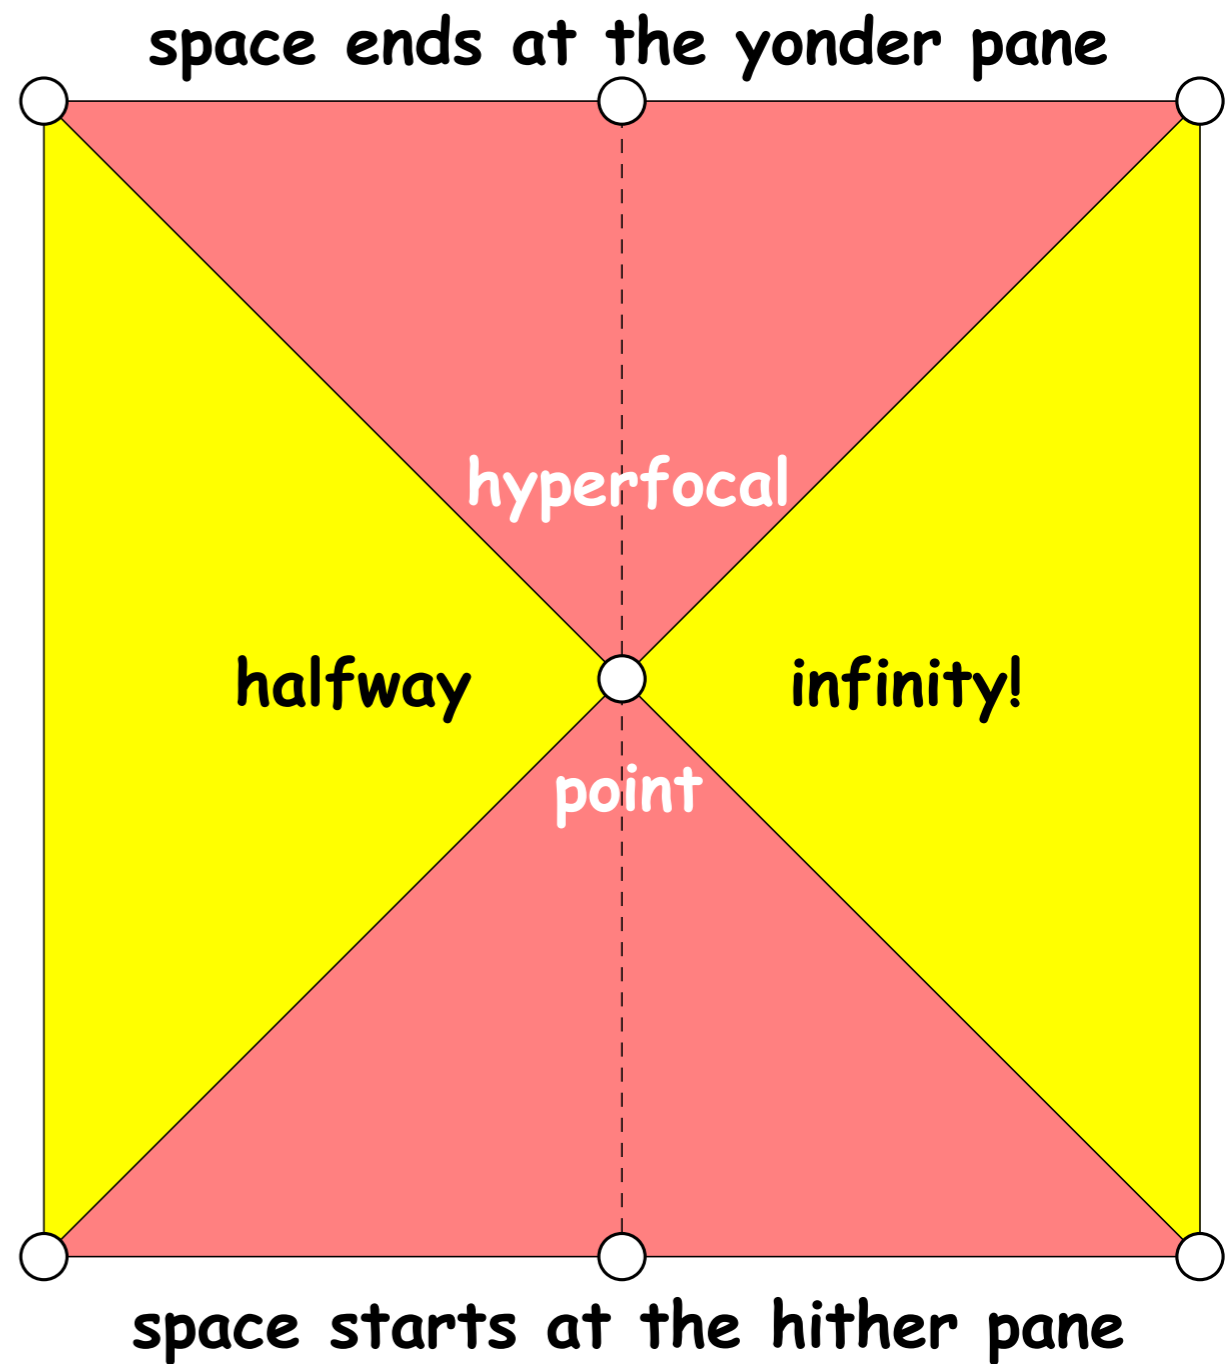

depth is read **front to back** by frontoparallel planes

reading starts at the viewport, which is momentarily set by **situational awareness**

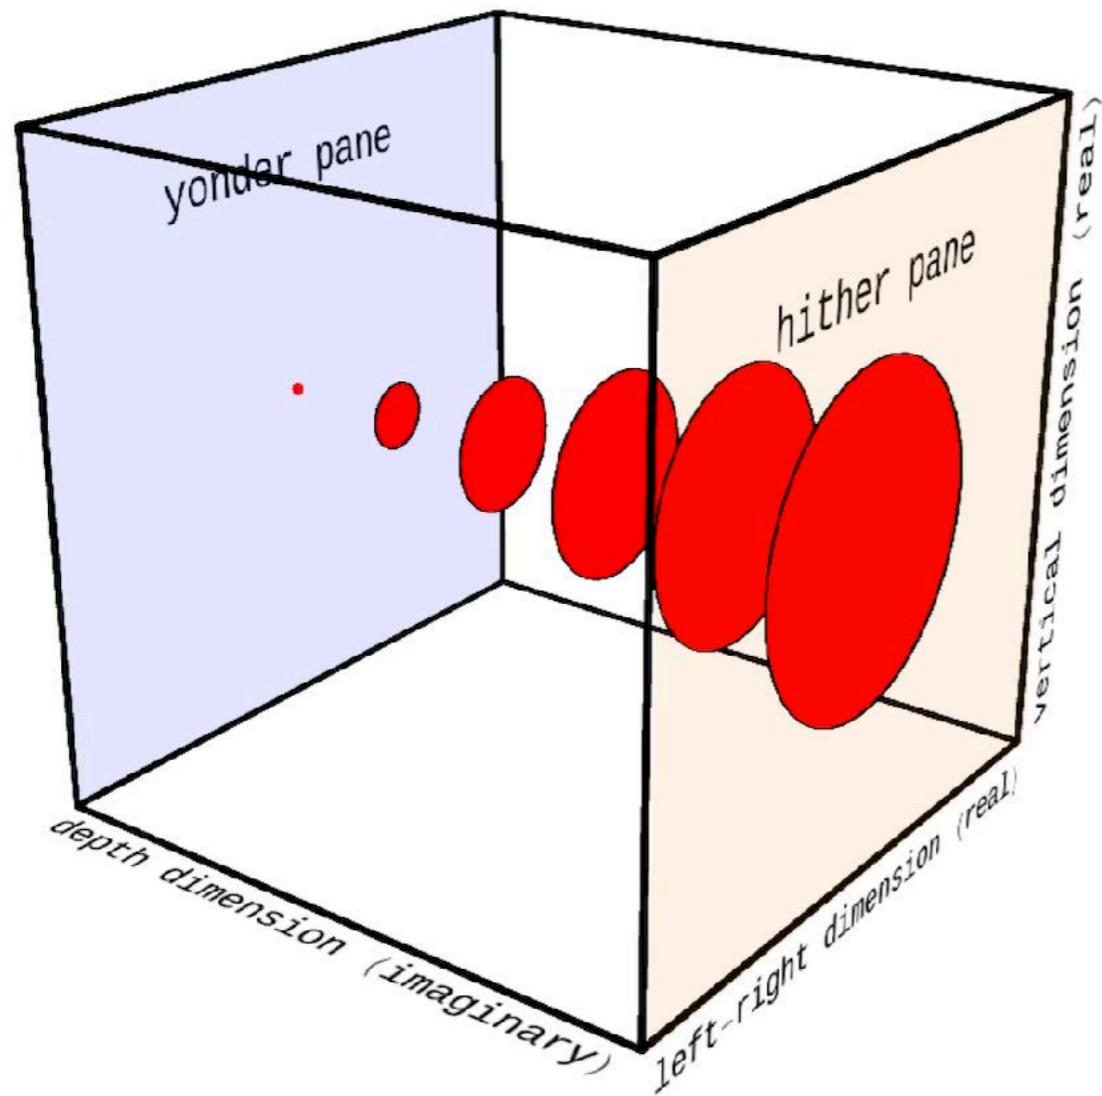

FRUSTUM (scene)

VIEWBOX (mind)

formally, the viewbox is just a projective map of the frustum

the deeper in the viewbox
the smaller things get in
the picture plane

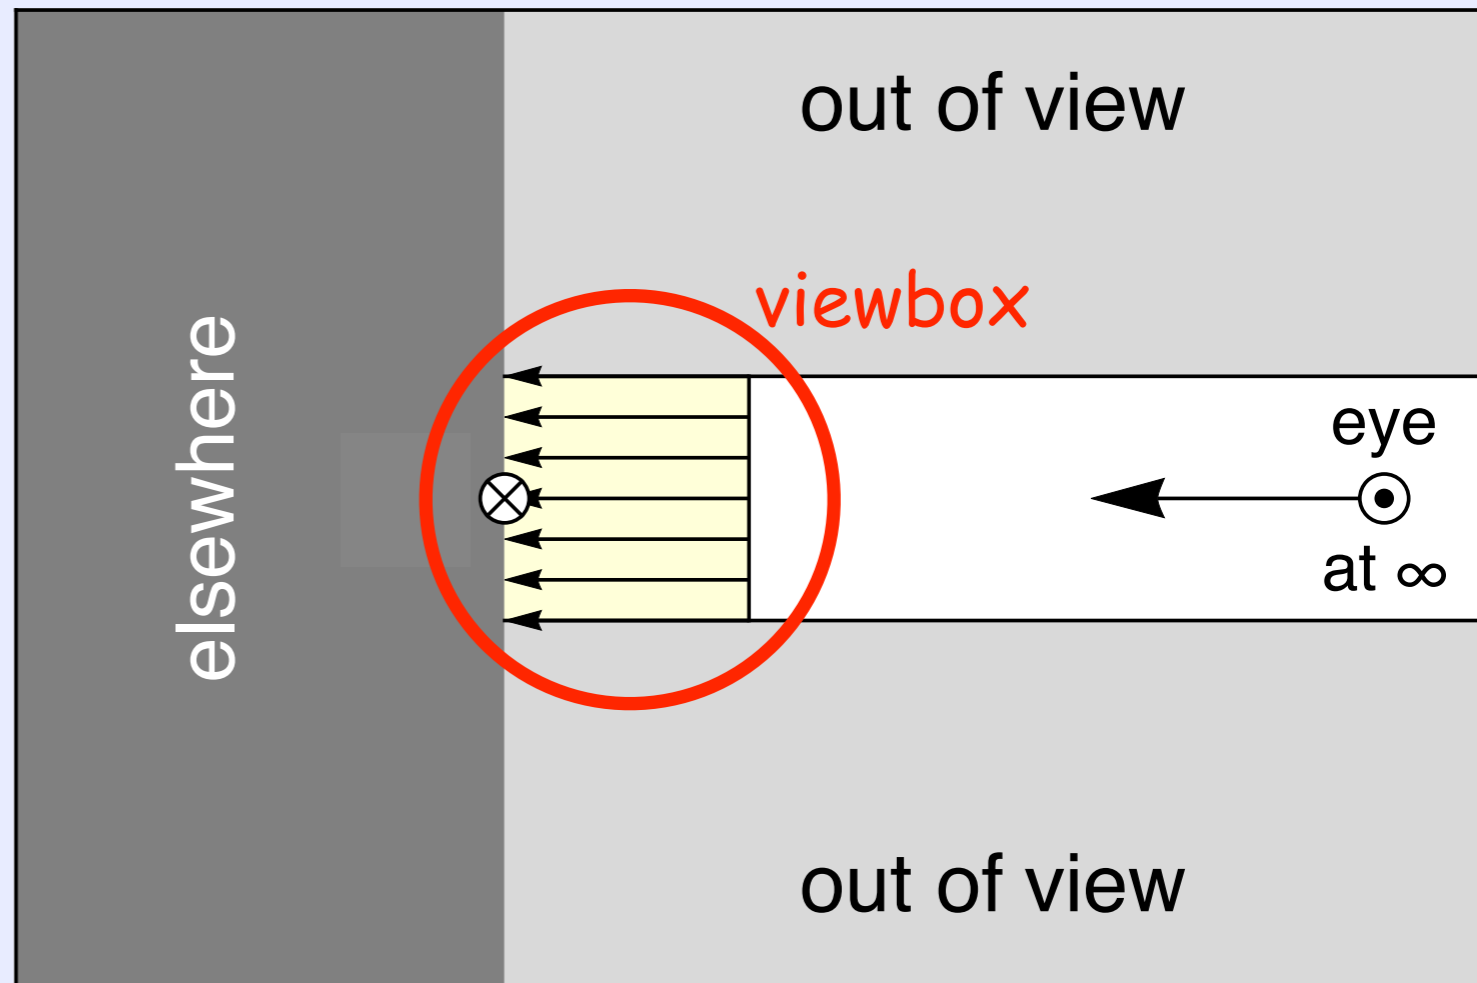

the deeper in the viewbox
the thinner space layers
become

the topology of the field of view in physical space

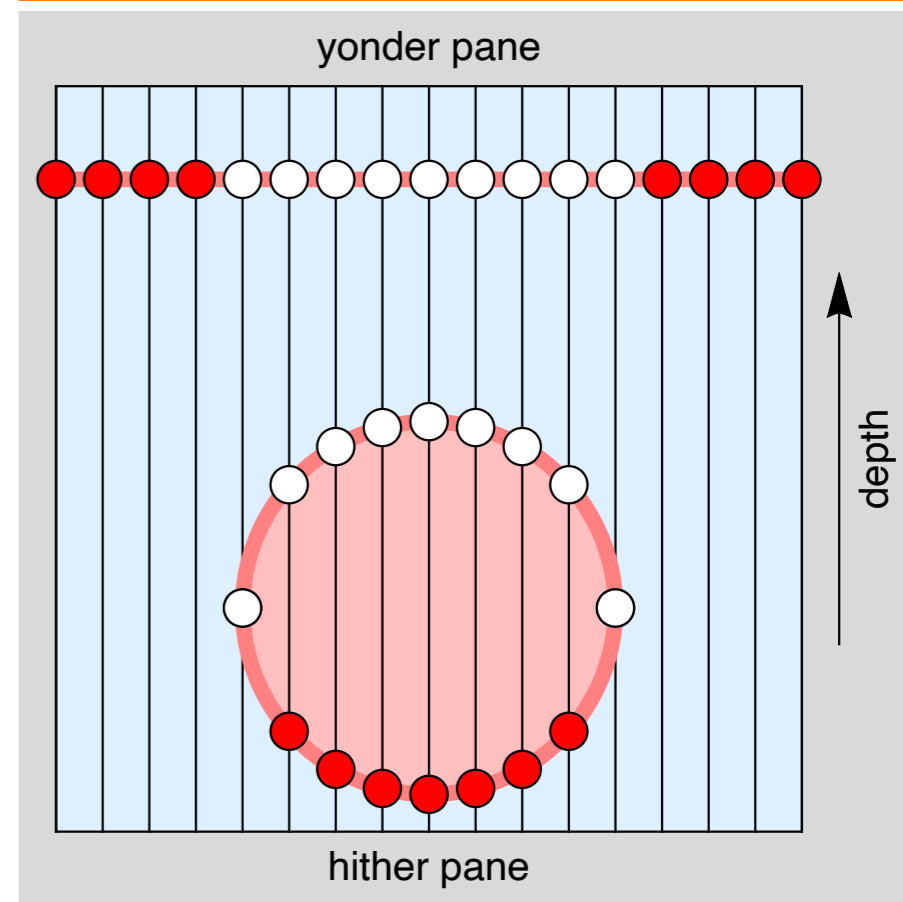

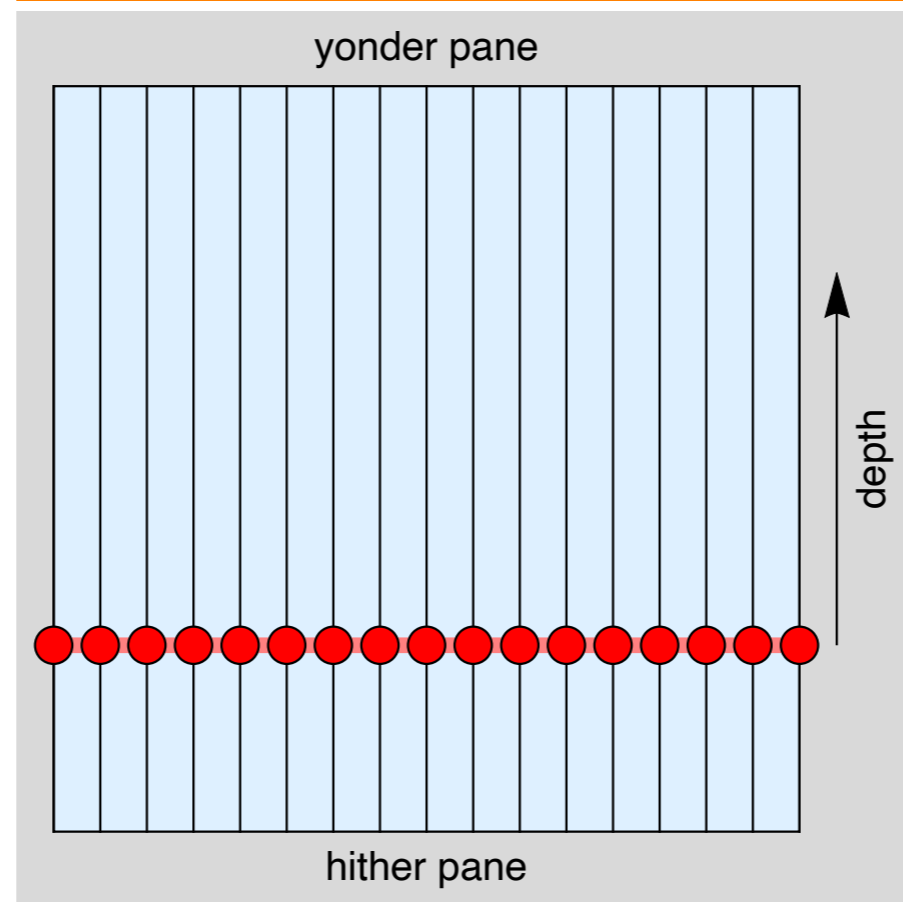

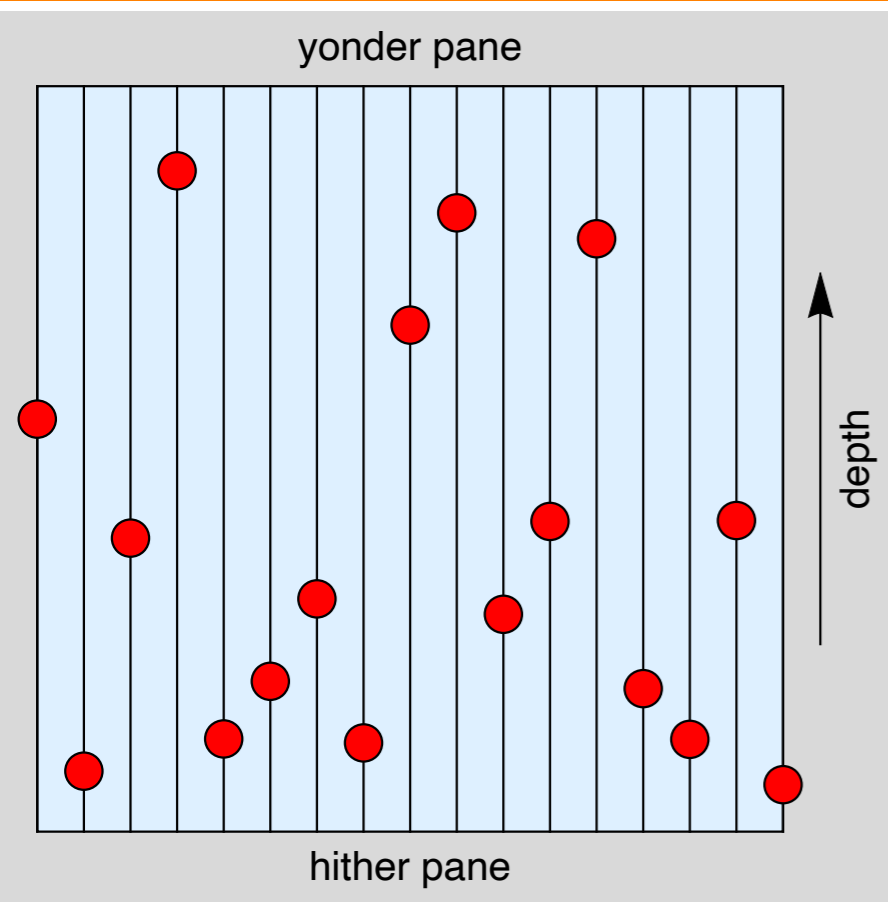

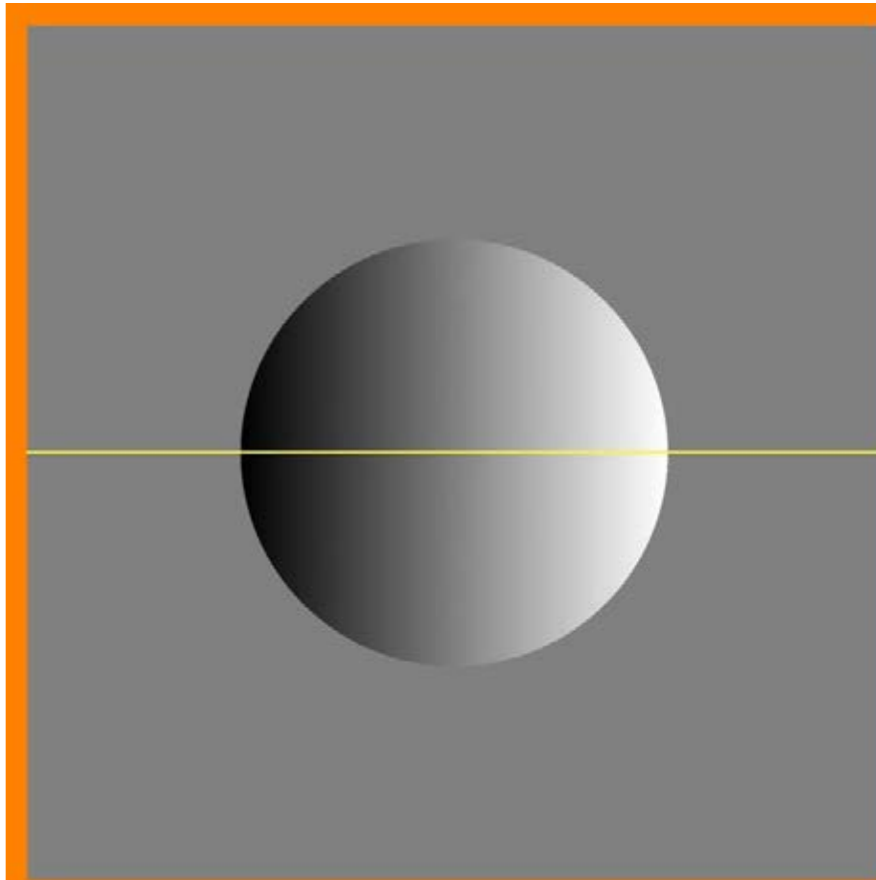

eye & principal vanishing point swapped!

the topology of the field of view in mental space

the **abacus model** of psychogenesis of awareness

the abacus model of the psychogenesis of pictorial space

< - bead shifting
ambiguous

no bead shifting
involved - >

how long is Nefertiti's nose?

volumetric space is read fore to aft
“beads are launched into depth”
the actual depth range is irrelevant

Theatrum des Hochfürstl. Lustgartens Mirabell .

"scenography" in garden theatre design

museum diorama with intruder, spoiling the "illusion"

scenographic design,
meant to be viewed frontally

**PICTORIAL
REPRESENTATION**

side view showing distance

**ways to
conceive of
the
viewbox**

Arnold Böcklin's painting **VITA SOMNIUM BREVE** makes a good example of composition in the viewbox

the fountain is located about halfway ($\infty/2$) the viewbox, the **hither pane** is in front of the children, the blue sky is the **yonder pane**, a **backdrop**

in the picture plane one has a **circular composition** centred on the fountain head

it has no (anti-)clockwise sense

such was only part of Böcklin's **intention**

the **planar design** is pretty tame and unrelated to the picture's **meaning** - although it does trigger the **first impression**

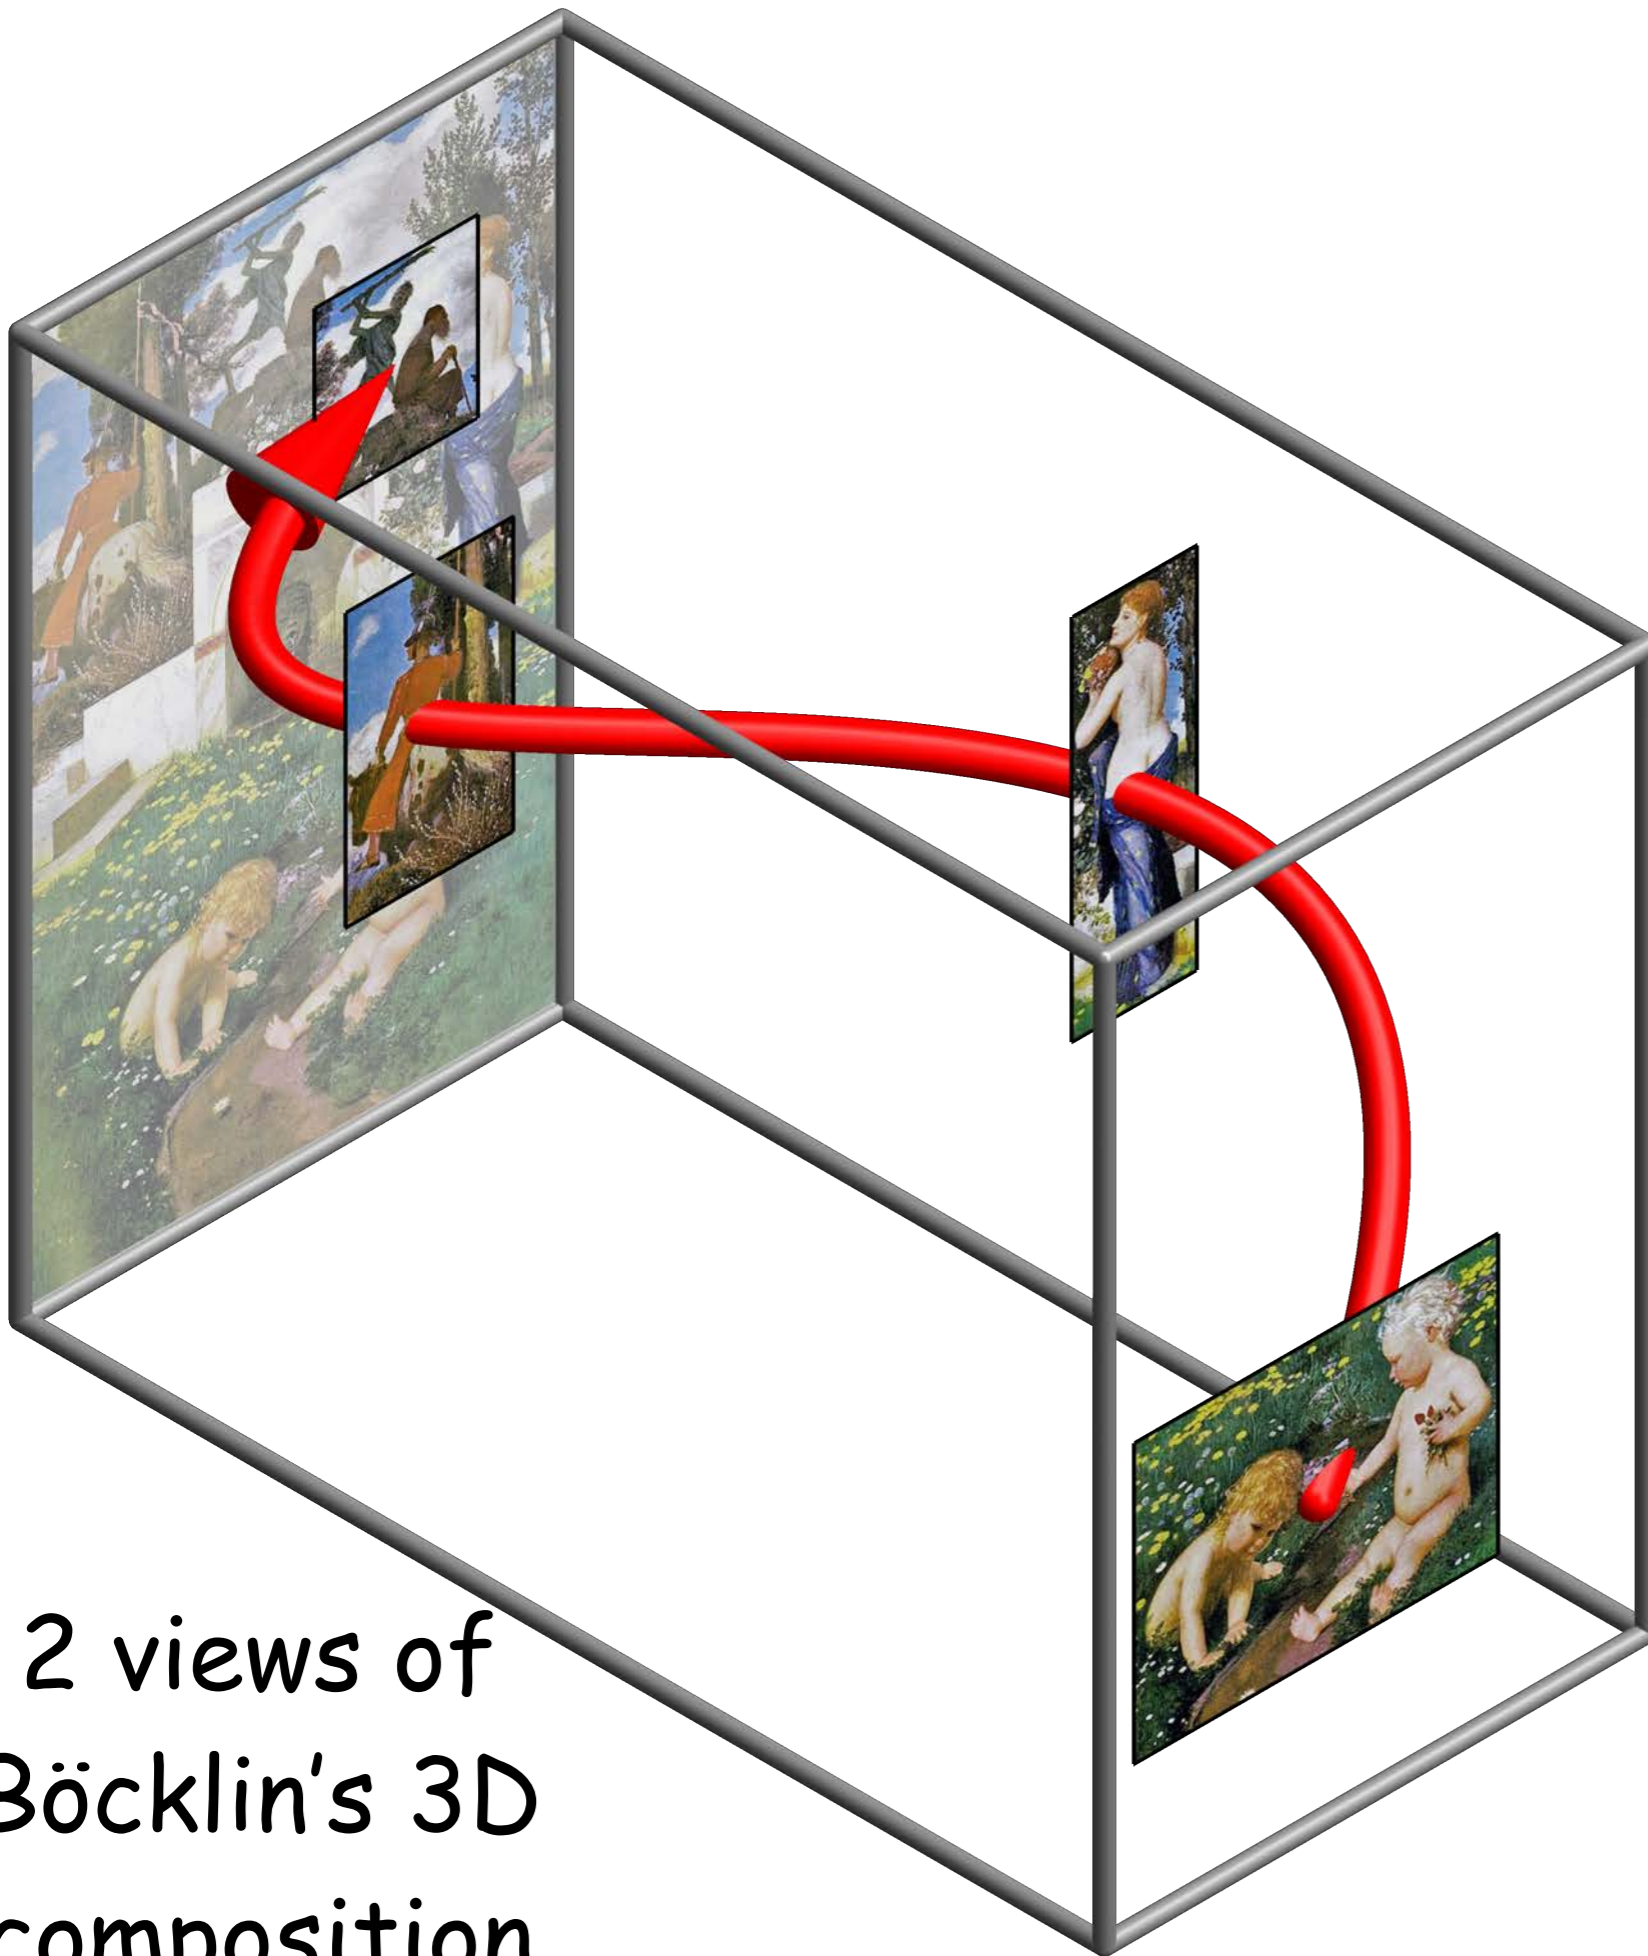

in the viewbox there is an evident **progression** from beginning to end

it is crucial to the picture's **meaning** "life a short dream"

the progression in the composition is a **twisted spiral** in the viewbox
it **cannot be shown in 2D**

the viewbox is a key
compositional tool

2 views of
Böcklin's 3D
composition

ICONIC IMAGES

pictures are pigments on canvas

images are mental figments

the **beholder** is just as important as

the **picture crafter** in creating imagery

pictorial space
is monocular
by its very
nature

Caspar David Friedrich

the **Field of Regard** is a quilt of "looks"
embedded in situational awareness
- it is not "iconic" -

the "perspective centre" of optical situational awareness is ill defined

- centre of the pupil
- rotation centre of the eyeball
- atlantoaxial joint of the neck
- body movements

"iconic vision" requires static, monocular looking

in order to appear **ICONIC** (a single thought)
a **distant view** (single fixation) is required

"distant"
implies
detached

Honoré Daumier

it is Adolf von Hildebrand's **Fernbild** notion

Salvador Dali

a picture
is not
a window

Karin Jurick

do they "see" the "same" thing? "Official" theory says NO!

Karin Jurick
Karin Jurick

Death's arrow always points at you - the oblique Death is even skinnier

WINDOW viewing - the content of the frustum

equivalent configurations

yield the same picture

such equivalences find use in stage design

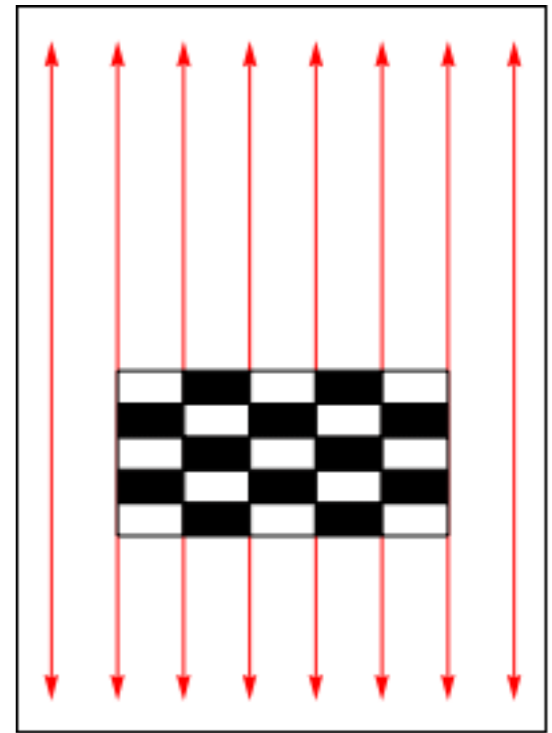

the bead shifting game respects the picture

translation
in depth

rotation
in depth

scaling
of depth

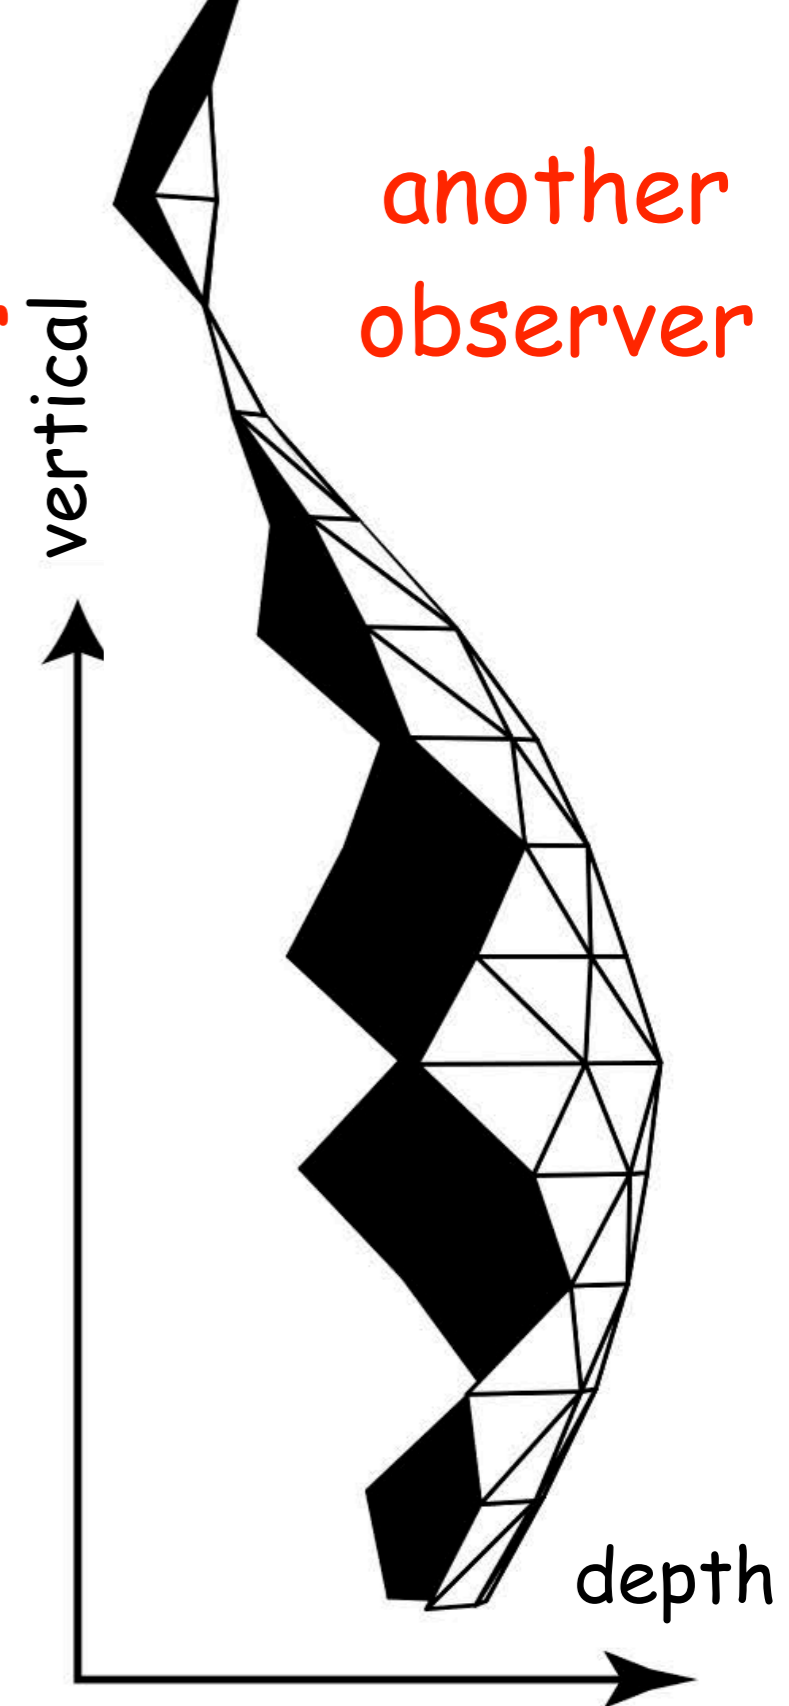

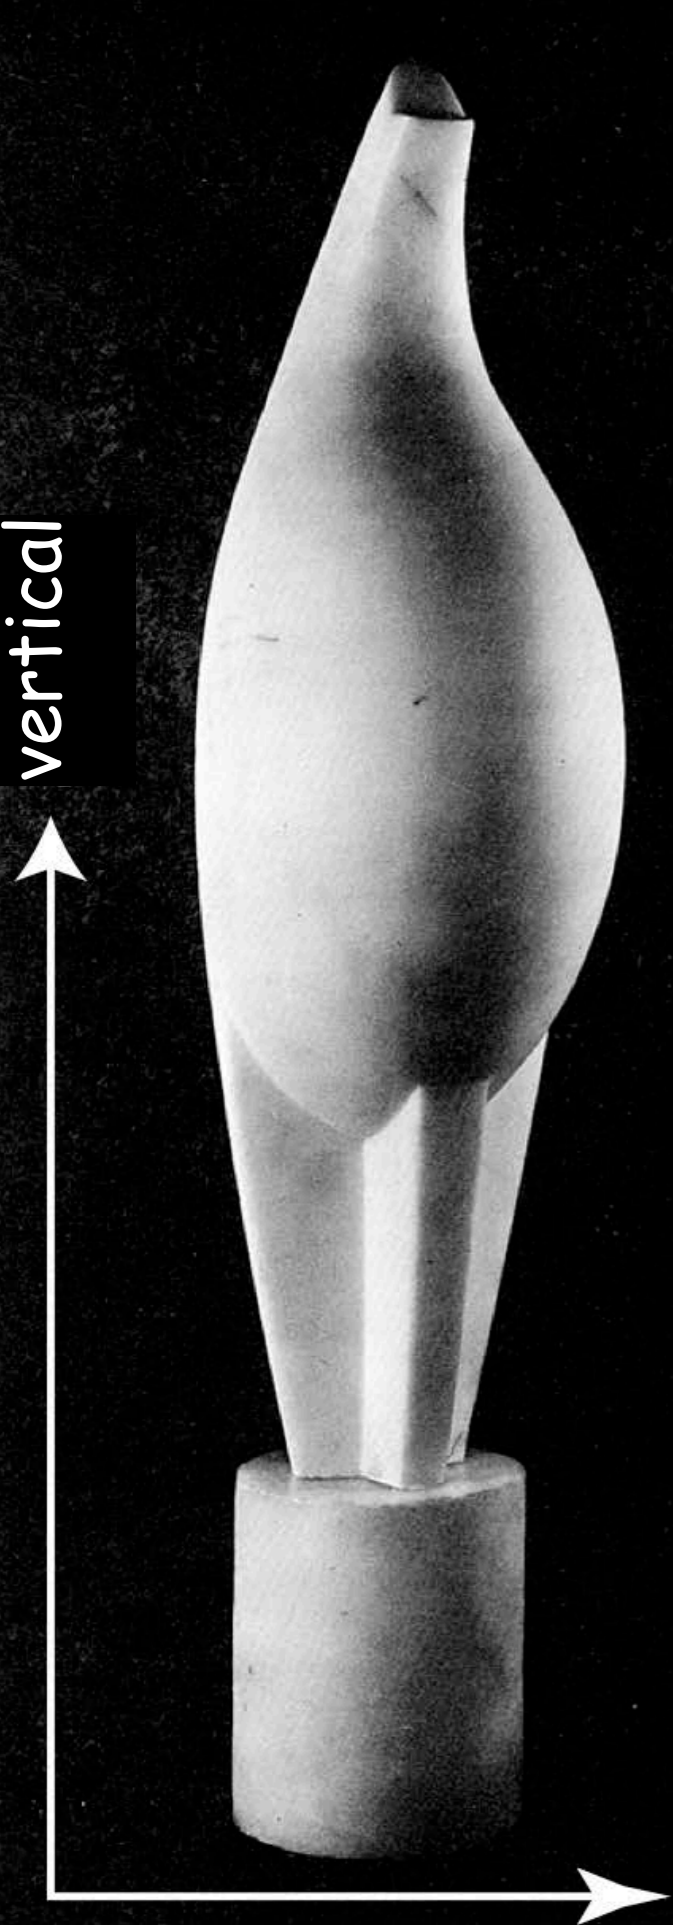

"mental movements" are part of the Beholder's Share

does the corner of this room subtend a right angle?

Charles Harbutt

there are infinite "solutions" to any picture
a "beholder's share" is a necessity!

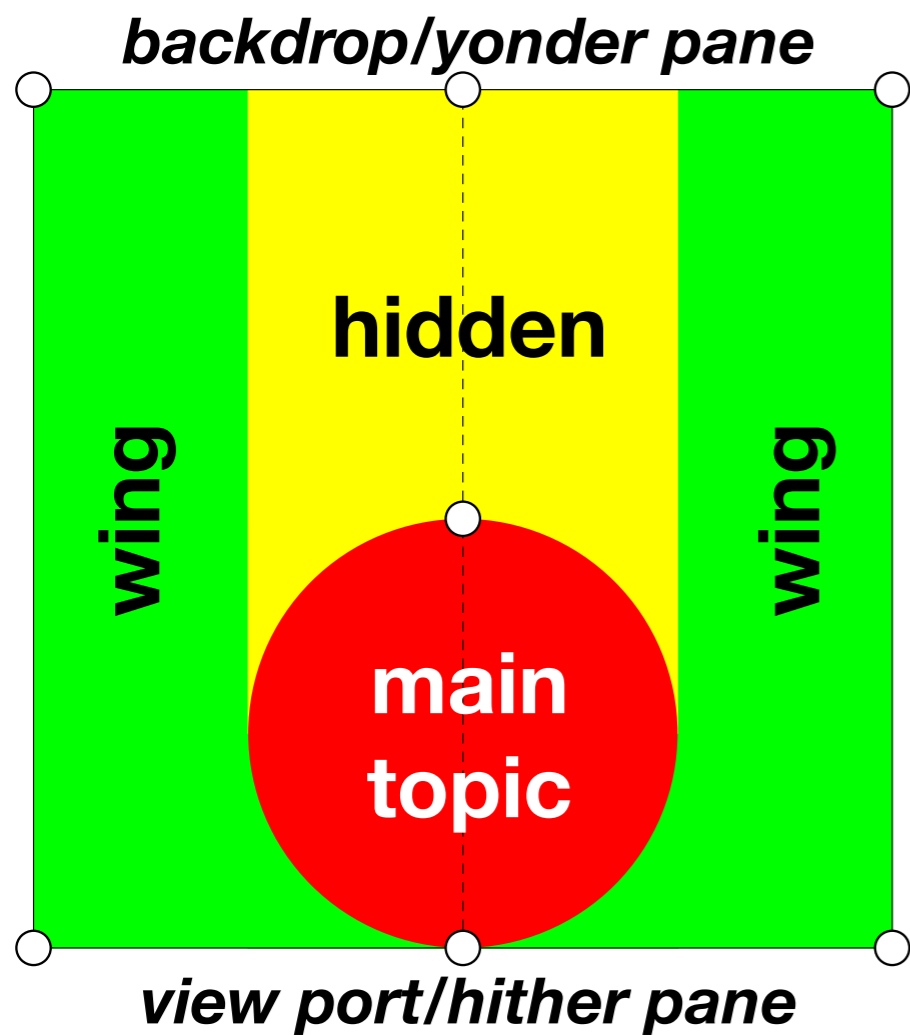

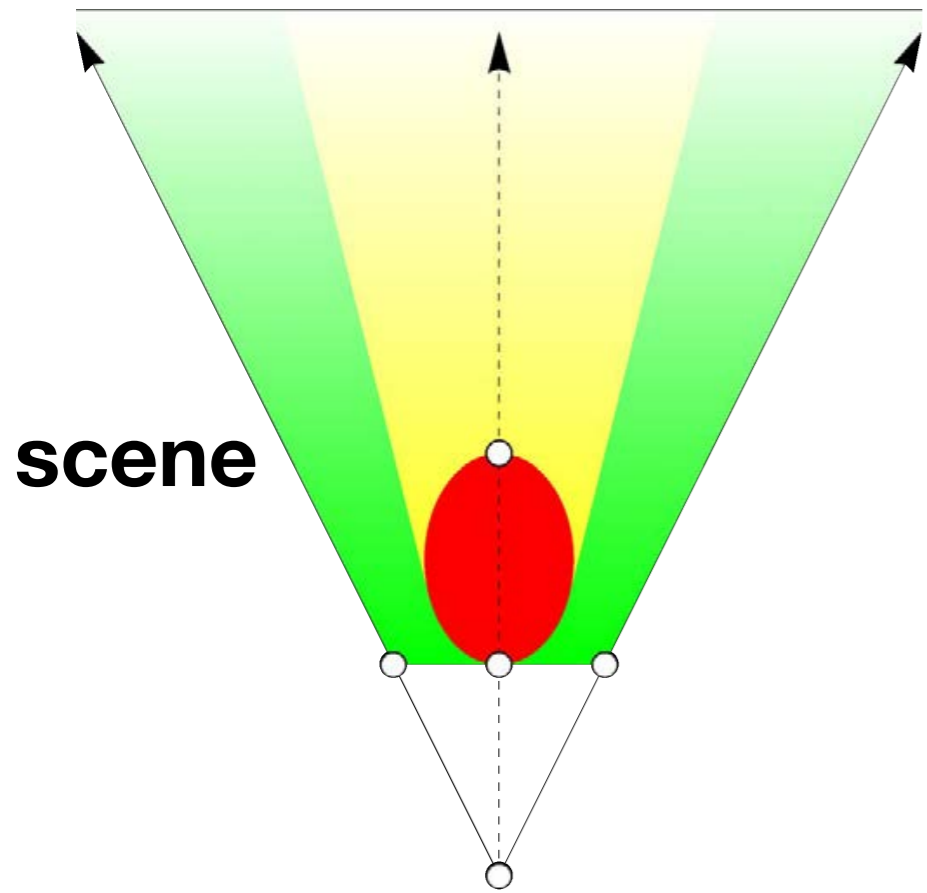

"mental movements" are a FACT,
at least in experimental phenomenology

THE "NORMAL" VIEW

ambiguities of optics force psychogenesis
to add a **Beholder's Share**

pictorial vision is **necessarily idiosyncratic**
because optical "data" is "incomplete"

Bill Brand's (1961)
Nude on the Beach
extends far into the
background

Mantegna's Dead Christ
(ca. 1480) is just a shallow
foreground

"abnormal" views cause "deformations"

Félix Vallotton

field of view ca 50° ("normal," no deformations)

Gerrit van Honthorst

field of view ca 20° (space "flattened")

a remarkable 180° field of view (space "expanded")

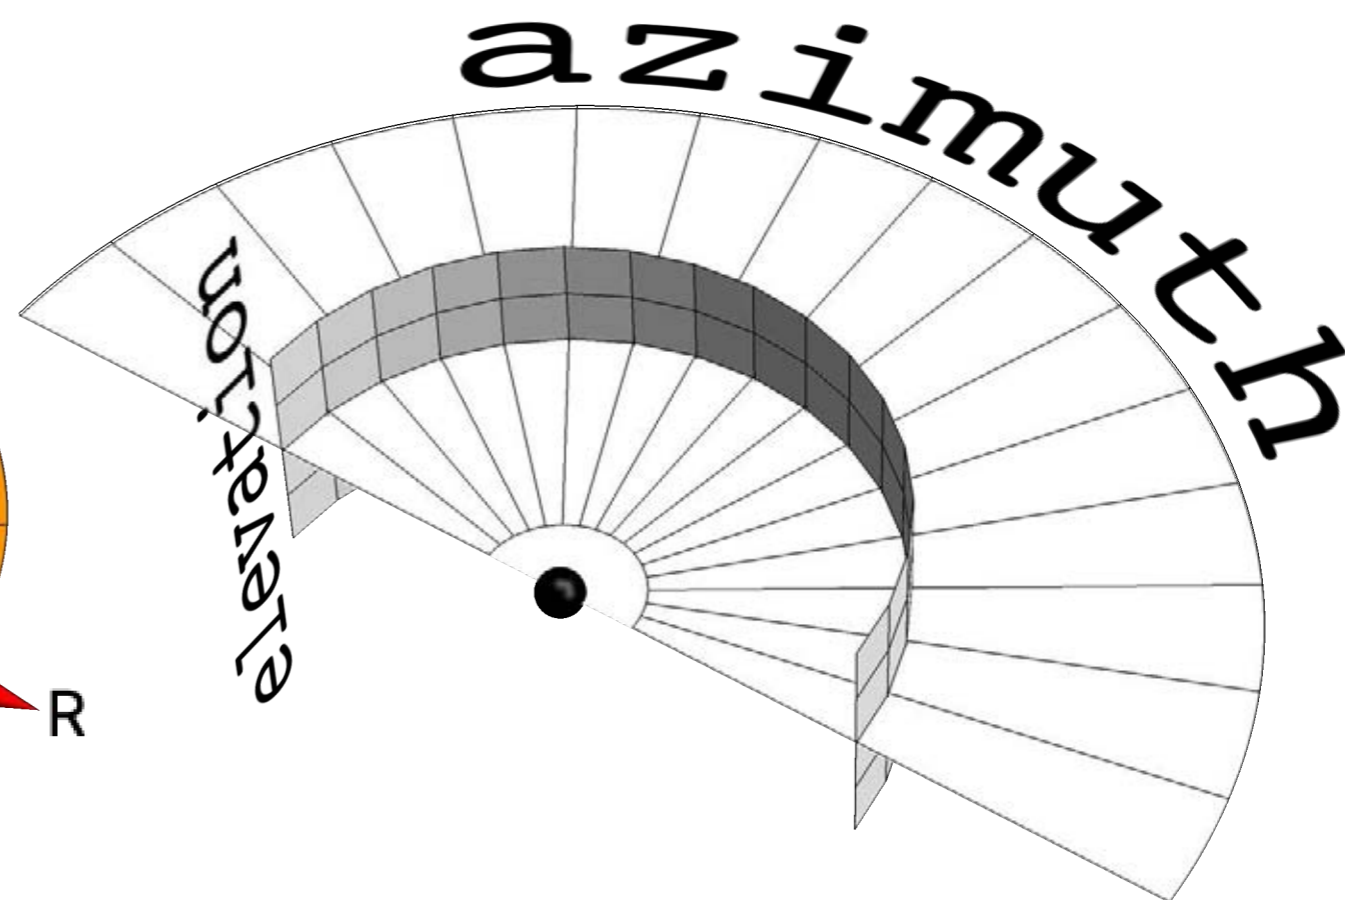

Carel Fabritius

it is in Hauck's projection ("Plattkarte," equirectangular)

the extent of the human field of view is far to large to be covered by the conventional perspective

some people see "everything in front of them"
others feel the visual field "extends beyond their ears"

the perfect military order is not SEEN that way!

facing the camera in circular arrangement does better!

visual psychogenesis works with model B, all the time

picture width

normal view:

picture width
 \approx
viewing distance

picture plane

viewing distance

$53^{\circ}7'48''$

35-50mm lens
on
"full frame"

eye

Elmar
lens F/3.5, 5 cm focus.

some perspectives of a cube
look like a long corridor,
others like a shallow slab

the "good" perspective
of a cube looks like this

there appears to **be** such a thing as a **normal view**
sentience simply ignores "proper" perspective

view from infinity

view from near

having all figures face the camera should cure the pesky perspective rotations

it takes care of the
rotation but ...

perspective "deformations"
make it look objectionable

Guido Hauck recommended the Plattkarte (so called equi-rectangular map) as more pleasant than linear perspective, at least for "Naturmenschen" such as artists, children and women (this was the 1880's)

as a boon it may map the full (360°) horizon whereas perspective is limited to (much!) less than a 180°

Guido Hauck's perspective saves the day, this looks good!
(but it is "wrong!")

a panoramic selfie of me in my living room

Hauck's plattkarte shows 360°x180° (left=right!)

it all goes haywire if you tilt the camera

if deformations don't bother you there are lots of better (e.g., conformal) options

the Pierce
quincuncial
is
conformal

much
depends
upon the
principal
viewing
direction

but: essentially anything will beat linear perspective ...

EFFECTIVE SPATIAL COMMUNICATION

Raphael

architecture & figures treated separately

Ferdinand Hodler

the bench is in perspective, seen from near
each of the men is seen frontally, from far

space layers treated
in parallel projection

foreground

middleground

background

2-5 depth layers (3 may be best, 7 is overkill) read well

it is like tones:  beats  ANYTIME!

it is much like music and applies to virtually all qualities like size, slope, tone, color, ..., as also DEPTH

富士山景
東海道
程ヶ谷

葛飾屋の主人

Katsushika Hokusai

just 3(!) trellises or coulisses yield perfect spatial clarity

non-perspective, even dystopic
renderings can be very effective

drawing from
the inside out
trades "depth"
for "plasticity"

Bellmer

Hans Bellmer

what about the space behind the figure?

the lure of "dystopia"

Poussin

Picasso

Picasso
